正面

- Silicone tape has a lower surface tension, and silica gel contains more "elasticity"
  硅胶胶带有着较低的表面张力，硅胶含有很多的“弹力”
- The bonding energy can be dispersed through the colloid, so that the viscose quickly conforms to the skin folds and quickly generates a fixed bonding force
  键结的能量能够通过胶体分散，使粘胶快速的服贴于皮肤皱褶，迅速地产生键结力
- Therefore, when removing the silicone tape, it will not cause the skin to be pulled up like using traditional tape, thereby reducing the pain and damage when the tape is removed
  因此，移除硅胶胶带时，不会与使用传统胶带一样，导致皮肤被拉起，进而减少胶带移除时的疼痛与损伤
