| 1 GENERAL DESCRIPTION | 8 |
| 1.1 Introduction | 8 |
| 1.2 Ordering information | 8 |
| 1.3 Features | 9 |
| 1.4 PAD Description..... | 11 |
| 1.4.1 Power Supply Part..... | 11 |
| 1.4.2 Analog Part..... | 12 |
| 1.4.3 Logic Part..... | 14 |
| 2 ELECTRICAL CHARACTERISTICS..... | 17 |
| 2.1 Absolute Maximum Ratings | 17 |
| 2.2 DC Electrical Characteristics | 18 |
| 2.2.1 DC Characteristics for Power Supply | 18 |
| 2.2.2 DC Characteristics for Generated Voltage | 18 |
| 2.2.3 DC Characteristics for Interface | 19 |
| 2.2.4 Power Consumption | 19 |
| 2.2.5 DC Characteristics for Internal Circuits | 20 |
| 2.2.6 DC Characteristics for Reset | 21 |
| 2.3 AC Characteristics | 22 |
| 2.3.1 MIPI DBI Type-C – Option1 (SPI 3 Wire)..... | 22 |
| 2.3.2 MIPI DBI Type-C – Option3 (SPI 4 Wire)..... | 23 |
| 2.3.3 Quad SPI | 24 |
| 2.3.4 MIPI DBI Type-B (MPU 8bit) | 25 |
| 2.4 MIPI Characteristics | 26 |
| 2.4.1 DC Characteristics for MIPI DSI | 26 |
| 2.4.2 MIPI Line Contention Detection..... | 27 |
| 2.4.3 MIPI DSI High-Speed RX Clock and Data-Clock Timing | 28 |
| 2.4.4 High Speed Clock and Data Timing | 29 |
| 3 FUNCTIONAL DESCRIPTION..... | 32 |
| 3.1 Tearing Effect Information..... | 32 |
| 3.1.1 Tearing Effect Control..... | 32 |
| 3.1.2 Tearing Effect Line Timings..... | 33 |
| 3.2 Sleep Out Command and Self-Diagnostic Functions | 34 |
| 3.2.1 Register Loading Detection | 34 |
| 3.2.2 Functionality Detection | 35 |
| 3.3 Power | 36 |
| 3.3.1 Power On/Off Sequence..... | 36 |
| 3.3.2 Power Levels | 38 |
| 3.3.3 Discharge Status of Power Block and I/O PADs | 38 |
| 3.3.4 Deep Standby Flow | 39 |
| 3.3.5 Sleep In/Out Flow | 40 |
| 3.4 Operation Sequence | 41 |
| 3.4.1 Display Operating Sequence..... | 41 |
| 3.5 Reset..... | 42 |
| 3.5.1 Register Value | 42 |
| 3.6 Modules Input/output/Bi-direction (I/O) PADs..... | 44 |
| 3.6.1 Output or Bi-directional (I/O) PADs | 44 |

| | |
|---|-----------|
| 3.6.2 Input PADs..... | 44 |
| 4 INTERFACE | 45 |
| 4.1 Interface Type Selection | 45 |
| 4.2 MIPI DBI Type-B and Type-C Interface Configuration..... | 47 |
| 4.3 MIPI DBI Interface Data Transfer Ignore and Pause | 47 |
| 4.4 MIPI DBI Type-B (MPU 8bit) Interface..... | 47 |
| 4.5 MIPI DBI Type-C (3-Wire 9-Bit) Interface | 48 |
| 4.6 MIPI DBI Type-C (4-Wire 8-Bit) Interface | 49 |
| 4.7 SPI Pixel Format..... | 50 |
| 4.8 Quad SPI Interface | 56 |
| 4.9 Extra Pixel Format for SPI Interface | 60 |
| 4.10 MIPI DSI..... | 61 |
| 4.10.1 DSI Feature | 62 |
| 4.10.2 DSI Layer Definitions..... | 62 |
| 4.10.3 Command and Video Mode | 62 |
| 4.10.4 DSI Physical Layer (D-PHY)..... | 63 |
| 4.10.5 MIPI DSI Protocol | 70 |
| 4.10.6 MIPI Interface Timing on Video Mode | 81 |
| 5 COMMAND | 84 |
| 5.1 List of User Command | 84 |
| 5.2 Description of User Command..... | 87 |
| 5.2.1 NOP (00h): No Operation | 87 |
| 5.2.2 SWRESET (01h): Software Reset..... | 88 |
| 5.2.3 RDDIDIF (04h): Read Display Identification Information..... | 89 |
| 5.2.4 RDNUMED (05h): Read Number of the Errors on DSI | 90 |
| 5.2.5 RDDPM (0Ah): Read Display Power Mode | 91 |
| 5.2.6 RDDMADCTL (0Bh): Read Display MADCTL..... | 93 |
| 5.2.7 RDDCOLMOD (0Ch): Read Display Pixel Format | 95 |
| 5.2.8 RDDIM (0Dh): Read Display Image Mode | 97 |
| 5.2.9 RDDSM (0Eh): Read Display Signal Mode | 98 |
| 5.2.10 RDDSDR (0Fh): Read Display Self-Diagnostic Result..... | 99 |
| 5.2.11 SLPIN (10h): Sleep In..... | 100 |
| 5.2.12 SLOUT (11h): Sleep Out..... | 101 |
| 5.2.13 PTION (12h): Partial Display Mode On | 103 |
| 5.2.14 NORON (13h): Normal Display Mode On | 104 |
| 5.2.15 INVOFF (20h): Display Inversion Off..... | 105 |
| 5.2.16 INVON (21h): Display Inversion On..... | 106 |
| 5.2.17 ALLPOFF (22h): All Pixel Off..... | 107 |
| 5.2.18 ALLPON (23h): All Pixel On | 108 |
| 5.2.19 DISPOFF (28h): Display Off | 109 |
| 5.2.20 DISPON (29h): Display On..... | 110 |
| 5.2.21 CASET (2Ah): Column Address Set..... | 111 |
| 5.2.22 PASET (2Bh): Page Address Set..... | 113 |
| 5.2.23 RAMWR (2Ch): Memory Write Start..... | 115 |
| 5.2.24 PTLAR (30h): Partial Area Row Set | 116 |
| 5.2.25 PTLAC (31h): Partial Area Column Set..... | 118 |
| 5.2.26 TEOFF (34h): Tearing Effect Off | 120 |
| 5.2.27 TEON (35h): Tearing Effect On | 121 |
| 5.2.28 MADCTL (36h): Memory Data Access Control | 123 |
| 5.2.29 IDMOFF (38h): Idle Mode Off..... | 125 |
| 5.2.30 IDMON (39h): Idle Mode On..... | 126 |

| | |
|--|-----|
| 5.2.31 COLMOD (3Ah): Control Interface Pixel Format | 127 |
| 5.2.32 RAMWRC (3Ch): Memory Write Continue | 129 |
| 5.2.33 TESCAN (44h): Set Tear Scan Line | 130 |
| 5.2.34 RDSCAN (45h): Read Scan Line Number | 132 |
| 5.2.35 SPI_RDOFF (46h): SPI Read Off | 133 |
| 5.2.36 SPI_RDON(47h): SPI Read On | 134 |
| 5.2.37 AODOFF (48h): AOD Mode Off | 135 |
| 5.2.38 AODON (49h): AOD Mode On | 136 |
| 5.2.39 AOD_WRDISBV (4Ah): Write Display Brightness Value in AOD Mode | 137 |
| 5.2.40 AOD_RDDISBV (4Bh): Read Display Brightness Value in AOD Mode | 138 |
| 5.2.41 DSTB (4Fh): Deep Standby Control | 139 |
| 5.2.42 WRDISBV (51h): Write Display Brightness Value | 140 |
| 5.2.43 RDDISBV (52h): Read Display Brightness Value | 141 |
| 5.2.44 WRCTRLD1 (53h): Write CTRL Display 1 | 142 |
| 5.2.45 RDCTRLD1 (54h): Read CTRL Display 1 | 143 |
| 5.2.46 WRCTRLD2 (55h): Write CTRL Display 2 | 144 |
| 5.2.47 RDCTRLD2 (56h): Read CTRL Display 2 | 145 |
| 5.2.48 WR_CE (58h): Write CE | 146 |
| 5.2.49 RD_CE (59h): Read CE | 147 |
| 5.2.50 HBM_WRDISBV (63h): Write Display Brightness Value in HBM Mode | 148 |
| 5.2.51 HBM_RDDISBV (64h): Read Display Brightness Value in HBM Mode | 149 |
| 5.2.52 HBMCTL (66h): HBM Control | 150 |
| 5.2.53 COLSET0 to COLSET15 (70h to 7Fh): SPI 1-1-1 Pixel Format Set | 151 |
| 5.2.54 COLOPT (80h): SPI 1-1-1/256 Pixel Format Option | 154 |
| 5.2.55 RDDDBS (A1h): Read DDB Start | 157 |
| 5.2.56 RDDDBC (A8h): Read DDB Continue | 158 |
| 5.2.57 RDFCS (AAh): Read First Checksum | 159 |
| 5.2.58 RDCCS (AFh): Read Continue Checksum | 160 |
| 5.2.59 SPI_MODE (C4h): SPI Mode Control | 161 |
| 5.2.60 RDID1 (DAh): Read ID1 | 163 |
| 5.2.61 RDID2 (DBh): Read ID2 | 164 |
| 5.2.62 RDID3 (DCh): Read ID3 | 165 |
| NOTICE | 166 |

Version History

April, 2021

| Ver. | Date | Page | Description of Changes |
|--------|--------------------|---------------|--|
| Ver0.0 | December. 2020 | | Initial Draft |
| Ver0.0 | February. 18. 2021 | p90, p93, p97 | Add 3553 Pixel Format for SPI |
| Ver0.0 | March. 24. 2021 | p22, p23 | Modify Figure 2, 3 |
| Ver0.0 | 29. Mar. 2021 | p53 to p55 | Modify Figure 30 to 33 (SPI4 Interface Pixel Format) |
| Ver0.0 | 30. Mar. 2021 | p127 | Correct typos in the table |
| Ver0.0 | 1. April. 2021 | p51, p54 | Modify Figure 27, 31 |
| Ver0.0 | 13. April. 2021 | p60 | Add Note (Extra Pixel Format) |

1 General description

1.1 Introduction

This IC is used for driving a 480RGBx480 LTPS AMOLED for a wearable or mobile application. It supports a low voltage operation and single chip solution including 240 Source channels. All circuits are designed suitable for AMOLED display panel. For high-speed data transfer, the data for display and command are received via MIPI DSI with 1-lane. Also SH8601Z supports MIPI DBI Type-B and Type-C interface. IC is connected to the Application Processor(AP) directly and stores display data into internal display GRAM which is sent from the AP. IC generates AMOLED driving signals by itself and stored display data can be performed with minimal power consumption. Also integrated Source driver, Panel Gate controller, GRAM, Power generation circuit, Voltage Regulator and Timing controller so on. The initialization settings can be partially or fully stored in the non-volatile memory(OTP) and these settings are loaded at the starting stagey of display. This IC provides a high-performance and higher display quality using minimum number of external components for lower power consumption and saving design cost and space.

- MIPI: Mobile Industry Processor Interface
- DSI: Display Serial Interface
- DBI: Display Bus Interface

1.2 Ordering information

- Product Code: SH8601Z
- Package: COF

1.3 Features

| Features | Description | |
|------------------------------------|--|---------------------------------------|
| Device Type | LTPS AMOLED Driver IC | |
| Display Resolution | Max. 480 RGB (H) x 480 (V) Support 1:6 MUX and 1:12 MUX Operation 4 Line Horizontal x 2 Line Vertical Control Step | |
| Color Depth | 16M Colors | |
| Display Type | Panel Type | AMOLED – Rigid & Flexible |
| | Pixel Arrangement | Real RGB, Delta RGB |
| | Source Output | 240CH with MUX |
| | GOA for Gate Output | GOAR[22:1], GOAL[22:1]. |
| | Support P-MOS Type Panel | |
| Interface | High Speed Interface | MIPI (DSI), Data 1 Lane, Clock 1 Lane |
| | D-PHY Version | v1.0 |
| | DSI Version | v1.02 |
| | Polarity Inversion of MIPI Pins | |
| | Support Command Mode | |
| | MIPI DBI Type-B (MPU 8-bit) and Type-C (3/4-wire mode), Quad-SPI | |
| Internal Graphics RAM | 480x480x24bits = 5,529,600bits | |
| Display Features | RGB separated gamma ACL, HBM Image Enhancement Functions : CRP, Sunlight Readability Enhancement | |
| One Time Programmable Device (OTP) | Program Voltage Supply | Only External Mode |
| | Size | 16K x 8bit (3times Re-writable) |
| | Built-in | Gamma, Chip ID, MCS register |
| On-chip Functions | Internal DC/DC Voltage Converter Timing Generator Adjustable Gamma Curves (Separated R/G/B) | |
| External Supply Voltages | Interface Power | VDDI = 1.8 V (1.65 V to 3.3 V) |
| | Analog Power | VCI = 2.8 V (2.7 V to 3.6 V) |
| Internal Drive Supply Voltages | AVDD | 4.6V to 7.0V |
| | VLOUT2 | 4.6V to 14.0V |
| | VLOUT3 | -14.0V to -4.6V |
| | VGH | 5.0V to 10.0V |
| | VGL | -10.0V to -5.0V |

SH8601Z

480x480 AMOLED Display Driver IC

| | | |
|-----------------------|--------------------|----------------|
| | UELVDD | 3.0V to 5.0V |
| | UELVSS | -4.0V to -0V |
| | VINT | -6.0V to -0.2V |
| | VREGOUT | 2.0V to 6.5V |
| | VGS | 0.0V to 3.3V |
| COF Package | | |
| Operating Temperature | -40 °C to + 85 °C | |
| Storage Temperature | -55 °C to + 125 °C | |

1.4 PAD Description

1.4.1 Power Supply Part

Table 1 PADs for Power Supply

| Symbol | I/O | Item | Function Description | Condition |
|----------|-----|---------------|---|-----------|
| VDDI | P | Voltage Range | Typ. = 1.80V (Min. = 1.65V, Max. = 3.3V) | |
| | | Unused | Required | |
| | | Component | Capacitor | |
| | | Description | Power supply for I/O block provided from outside VDDI < 0.05V (When power is turned off) | |
| VCI | P | Voltage Range | Typ. = 2.8V (Min. = 2.70V, Max. = 3.60V) | |
| | | Unused | Required | |
| | | Component | Capacitor | |
| | | Description | Power Supply for Analog Circuits VCI < 0.05V (When power is turned off) | |
| VOTP | P | Voltage Range | Typ. = 6.0V (Min. = 5.8V, Max. = 6.2V) | |
| | | Unused | Open | |
| | | Description | External Voltage Input for OTP Data Program | |
| VSSI | P | Description | GND for I/O Block provided from outside (VSSI = 0V) | |
| VSS | P | Description | GND for Logic Block (VSS = 0V) | |
| VSSM | P | Description | GND for Memory Block (VSSM = 0V) | |
| VSS_MIPI | P | Description | GND for MIPI DSI receiver (VSS_MIPI = 0V) | |
| VSSA | P | Description | GND for Analog circuits (VSSA = 0V) | |
| VSSC | P | Description | GND for DCDC block (VSSC = 0V) | |

1.4.2 Analog Part

Table 2 PADs for Analog Power

| Symbol | I/O | Item | Function Description | Condition | |
|-----------|-----|---------------|--|-------------------------|--|
| AVDD | O | Voltage Range | Min. = 4.6V Max. = 7.0V | AVDD-VREGOUT = Min.0.5V | |
| | | Component | Capacitor | | |
| | | Description | Power supply for Source Driver and Booster | | |
| C11P C11N | O | Voltage Range | Min. = 0.0V Max. = 7.0V | | |
| | | Unused | Open | | |
| | | Component | Capacitor | | |
| | | Description | Charge-pumping capacitor. | | |
| C12P C12N | O | Voltage Range | Min. = 0.0V Max. = 7.0V | | |
| | | Unused | Open | | |
| | | Component | Capacitor | | |
| | | Description | Charge-pumping capacitor. | | |
| VLOUT2 | O | Voltage Range | Min. = AVDD Max. = AVDD x 2 | VLOUT2-VGH = Min.2.0V | |
| | | Component | Capacitor | | |
| | | Description | Power Supply for VGH | | |
| C21P C21N | O | Voltage Range | Min. = 0.0V Max. = AVDD x 2 | | |
| | | Unused | Open | | |
| | | Component | Capacitor | | |
| | | Description | Charge-pumping capacitor | | |
| VLOUT3 | O | Voltage Range | Min. = -AVDD x 2 Max. = -AVDD | VLOUT3-VGL = Min. 2.0V | |
| | | Component | Capacitor | | |
| | | Description | Power Supply for VGL | | |
| C31P C31N | O | Voltage Range | Min. = -AVDD Max. = AVDD | | |
| | | Unused | Open | | |
| | | Component | Capacitor | | |
| | | Description | Charge-pumping capacitor | | |
| C32P C32N | O | Voltage Range | Min. = -AVDD x 2 Max. = -AVDD | | |
| | | Unused | Open | | |

SH8601Z
480x480 AMOLED Display Driver IC

| Symbol | I/O | Item | Function Description | Condition | |
|---------|-----|---------------|--|------------------------|--|
| | | Component | Capacitor | | |
| | | Description | Charge-pumping capacitor | | |
| VREGOUT | O | Voltage Range | Min. = 2.0V Max. = 6.5V | lower than AVDD – 0.5V | |
| | | Unused | Required | | |
| | | Component | Capacitor(optional) | | |
| | | Description | Reference High Voltage Output for Grayscale Voltage Generator. | | |
| VGS | O | Voltage Range | Min. = 0.0V Max. = 3.3V | | |
| | | Unused | Required | | |
| | | Component | Capacitor(optional) | | |
| | | Description | Reference Low Voltage Output for Grayscale Voltage Generator. | | |
| VGH | O | Voltage Range | Min. = 5.0V Max. = 10.0V | – | |
| | | Unused | Required | | |
| | | Component | Capacitor | | |
| | | Description | Reference High Voltage Output for Gate Driver. | | |
| VGL | O | Voltage Range | Min. = -10.0V Max. = -5.0V | – | |
| | | Unused | Required | | |
| | | Component | Capacitor | | |
| | | Description | Reference Low Voltage Output for Gate Driver | | |
| VINT | O | Voltage Range | Min. = -6.0V Max. = -0.2V | | |
| | | Unused | Required | | |
| | | Component | Capacitor | | |
| | | Description | Reference Voltage Output for Pixel Initialization | | |
| UELVDD | O | Voltage Range | Min. = 3.0V Max. = 5.0V | | |

2 Electrical Characteristics

2.1 Absolute Maximum Ratings

It defines the maximum operating conditions. The reliability of IC is not guaranteed if used in the conditions beyond the limits and it may lead to malfunction.

Table 4 Absolute Maximum Ratings

| Parameter | Symbol | Ratings | Unit |
|------------------------------------|------------------|---------------------|------|
| Supply Voltage for I/O Block | VDDI-VSS | – 0.3 to + 3.6 | V |
| Supply Voltage for Step-up Circuit | VCI-VSS | – 0.3 to + 4.0 | V |
| AMOLED Supply Voltage Range | AVDD-VSS | – 0.3 to + 8.4 | V |
| | VSS-VINT | – 0.3 to + 6.6 | V |
| | VLOUT2-VSS | – 0.3 to + 15.0 | V |
| | VSS-VLOUT3 | – 0.3 to + 15.0 | V |
| | VGH-VSS | – 0.3 to + 11 | V |
| | VSS-VGL | – 0.3 to + 11 | V |
| | UELVDD – VSS | – 0.3 to + 5.5 | V |
| | VSS- UELVSS | – 0.3 to + 4.4 | V |
| | VLOUT2- VLOUT3 | – 0.3 to + 26 | V |
| | VOTP-VSS | – 0.3 to + 6.2 | V |
| Supply Voltage for OTP | Vin | – 0.3 to VDDI + 0.3 | V |
| Input Voltage Range | T _{stg} | – 55 to + 125 | °C |

NOTE: Conditions outside the range listed in the above table may cause permanent damage to the device, may not be recovered. It is strongly recommended to use the IC within the limits of its electrical characteristics during normal operation. Absolute voltages are referenced to ground. The functional operation of the device is not implied for these conditions.

2.2 DC Electrical Characteristics

2.2.1 DC Characteristics for Power Supply

Table 5 DC Characteristics for Power Lines

| Parameter | Symbol | Condition | Specification | | | Application Pin | Unit | Note |
|----------------------|--------|-----------|---------------|------|------|-----------------|------|------|
| | | | Min. | Typ. | Max. | | | |
| Power supply voltage | VDDI | | 1.65 | 1.8 | 3.3 | VDDI | V | |
| | VCI | | 2.7 | 2.8 | 3.6 | VCI | | |
| | VOTP | | | 6.0 | | VOTP | | |

NOTE: TA = – 40 to 85 °C

2.2.2 DC Characteristics for Generated Voltage

Table 6 DC Characteristics for Power Lines

| Parameter | Symbol | Condition | Specification | | | Unit | Note |
|-------------------|---------|------------------------|---------------|------|-------|------|------|
| | | | Min. | Typ. | Max. | | |
| Operation voltage | VREGOUT | VREGOUT < AVDD – 0.5 V | 2.0 | – | 6.5 | V | |
| | VGS | | 0 | – | 3.3 | | |
| | VINT | VINT > VLOUT3 + 2.0V | -6.0 | – | - 0.2 | | |
| | VGH | VGH < VLOUT2 – 2.0V | 5.0 | – | 10.0 | | |
| | VGL | VGL > VLOUT3 + 2.0V | -10.0 | – | -5.0 | | |
| | AVDD | VCI x 2, VCI x 3 | 4.6 | – | 7.0 | | |
| | VLOUT2 | VLOUT2-VLOUT3 < 25 V | 4.6 | – | 14 | | |
| | VLOUT3 | | -14 | – | -4.6 | | |

NOTE: TA = – 40 to 85 °C

2.2.3 DC Characteristics for Interface

Table 7 DC Characteristic for Interface Signals

| Parameter | Symbol | Condition | Specification | | | Pin | Unit |
|----------------------------------|---------|---------------|---------------|------|------------|------|------|
| | | | Min. | Typ. | Max. | | |
| Logic high level input voltage | VIH_IO1 | – | 0.8 × VDDI | – | VDDI | RESX | V |
| Logic low level input voltage | VIL_IO1 | – | 0.0 | – | 0.2 × VDDI | | |
| Logic high level output voltage | VOH_IO1 | IOUT = – 1 mA | 0.8 × VDDI | – | VDDI | TE | μA |
| Logic low level output voltage | VOL_IO1 | IOUT = + 1 mA | 0.0 | – | 0.2 × VDDI | | |
| Input high level leakage current | IIH | VIN = VDDI | – | – | 1 | RESX | μA |
| Input low level leakage current | IIL | VIN = VSS | – 1 | – | – | | |

NOTE: TA = – 40 to 85 °C

2.2.4 Power Consumption

Table 8 Power Consumption

| Parameter | Symbol | Condition | Specification | | | Unit | Note |
|---|-----------------------|---|---------------|------|-------|------|--------|
| | | | Min. | Typ. | Max. | | |
| Operating current (DSI, dynamic display) | IVDDI _{op} | Frame frequency = 60 Hz No load SR_SET = 5'b10110 SPR Function OFF | – | – | 2.805 | mA | (NOTE) |
| | IVCI _{op} | | – | – | 5.5 | | |
| Sleep current | IVDDI _{LP} | LP11 mode | – | – | 225 | uA | |
| | IVCI _{LP} | | – | – | 50 | | |
| Deep standby current | IVDDI _{ULPS} | ULPS mode | – | – | 200 | uA | |
| | IVCI _{ULPS} | | – | – | 50 | | |
| Deep standby current | IVDDI _{DSLP} | | – | – | 4 | uA | |
| | IVCI _{DSLP} | | – | – | 2 | | |

NOTE: The table above shows only driver IC's power consumption. (MIPI I/F @0.5Gbps, white pattern).

VCI = 2.8V, VDDI = 1.8V, TA = 25 °C.

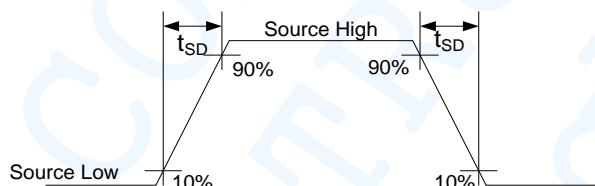

2.2.5 DC Characteristics for Internal Circuits

Table 9 DC Characteristics for Internal Circuits

| Characteristic | Symbol | Condition | Min. | Typ. | Max. | Unit | Note |
|--|---------------|---|-----------------|--------|-----------|------|------|
| Operating frequency | $F_{oscTA25}$ | TA = 25 °C | 21.34 | 22 | 22.6 6 | MHz | |
| Voltage efficiency of Step-up output | VLOUT2 | $I_{VLOUT2} = -0.5mA$, TA = 25 °C | 90 | — | — | % | |
| | VLOUT3 | $I_{VLOUT3} = +0.5mA$, TA = 25 °C | 90 | — | — | | |
| Panel driving voltage | VGH | $I_{VGH} = -0.5mA$, TA = 25 °C | Target - 0.1 | Target | — | V | |
| | VGL | $I_{VGL} = +0.5mA$, TA = 25 °C | Target - 0.1 | Target | — | | |
| | VINT | $I_{VINT} = +0.5mA$, TA = 25 °C | Target - 0.1 | Target | — | | |
| Output on resistance of Gate driver | R_{onVgh} | VGH = 6.6 V VGL = -8.0 V | — | — | 2 | kΩ | |
| | R_{onVgl} | | — | — | 2 | | |
| Delay, Source driver | t_{SD} | AVDD = 5.6 V VREGOUT = 5.0 V VGS = 2.0 V SR_SET = 5'b10110 | — | — | 1.8 | μs | (1) |
| Source output voltage deviation: mean value (channel to channel) | ΔV_o | $VSS + 1.0V < V_{so} < AVDD - 1.0V$ | — | — | ± 5 | mV | (2) |

NOTE: TA = – 40 to 85 °C Unless Otherwise Specified

1. Measurement condition (Delay Measurement of Source Driver), EDS load (0.1k,100pF)

2. SR_SET=5b'10110, Offset cancellation condition=ON

2.2.6 DC Characteristics for Reset

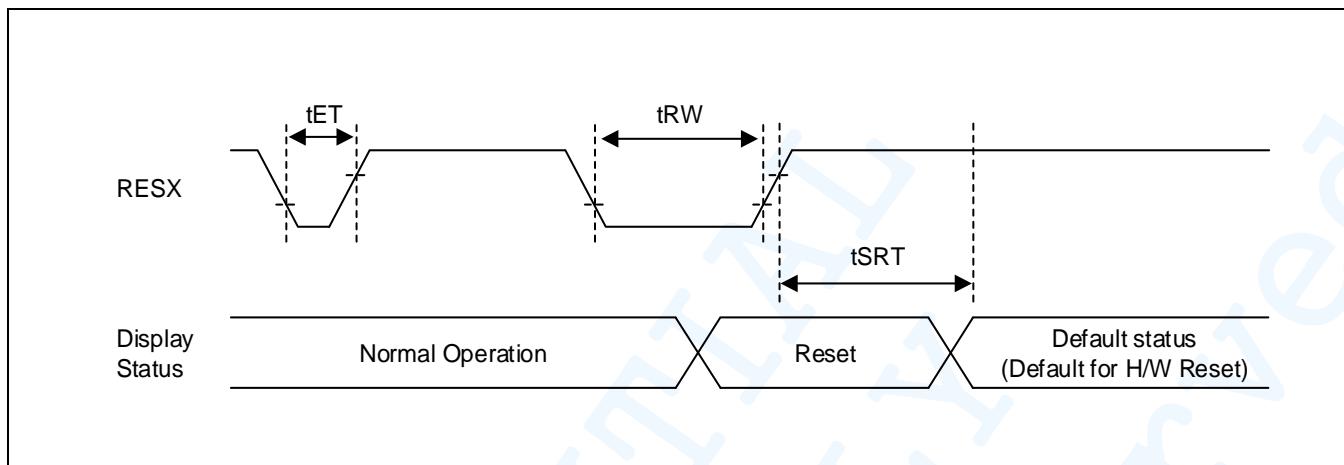

Figure 1 Reset Input Timing

Table 10 Reset Input Timing

| Parameter | Symbol | Pad | Min. | Typ. | Max. | Unit | Note |
|------------------------------|--------|------|------|------|------|------|-----------------------------|
| Reset low pulse width | tRW | RESX | 10 | — | — | μs | — |
| Secure reset completion time | tSRT | RESX | — | — | 5 | ms | Reset during Sleep In mode |
| | | RESX | — | — | 150 | | Reset during Sleep Out mode |
| Reset un-reacted pulse width | tET | RESX | | | 5 | μs | — |

NOTE:

1. Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below.

Table 11 RESX Pulse

| RESX Pulse | Action |
|------------------------|----------------|
| Shorter than 5 μs | Reset rejected |
| Longer than 10 μs | Reset |
| Between 5 μs and 10 μs | Reset start |

2. During the reset period, the display will be blanked (The display is entering blanking sequence, for which the maximum time is 150ms, when Reset starts in Sleep Out-mode. The display remains in the blank state in Sleep In-mode) and then return to Default condition for H/W reset.
3. During Reset Completion Time, ID bytes (or similar) value in OTP will be latched to the internal register during this period. This loading is done every time when there is H/W reset complete time (tSRT) within 5ms after a rising edge of RESX.

2.3 AC Characteristics

2.3.1 MIPI DBI Type-C – Option1 (SPI 3 Wire)

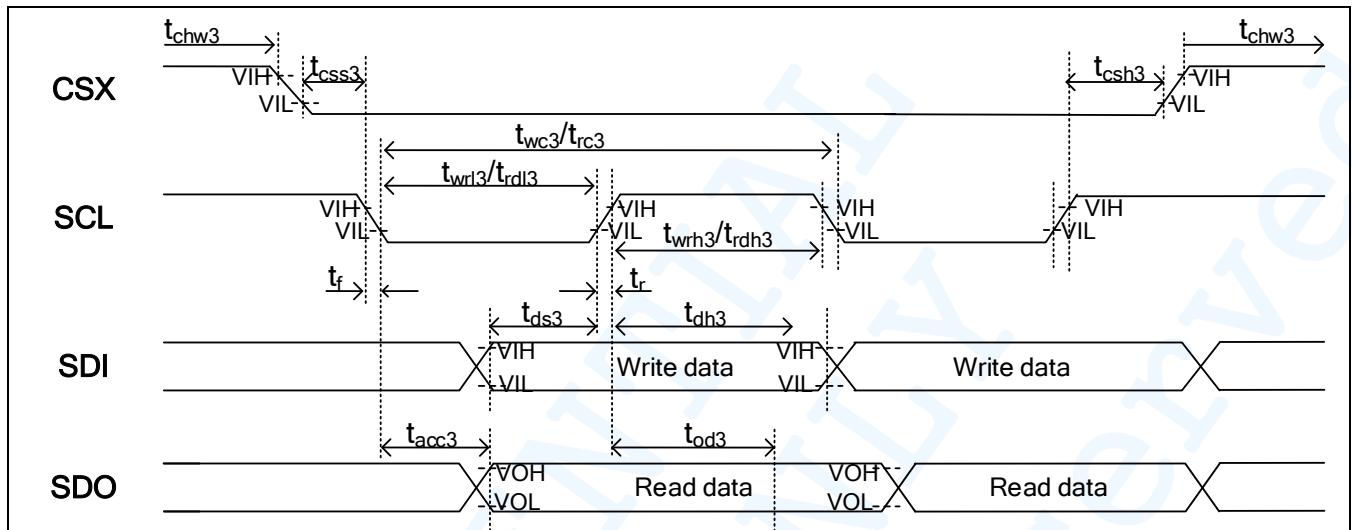

Figure 2 3 Wire 9bit Serial Interface Characteristics

Table 12 AC Characteristics of MIPI DBI Type-C – Option1 (SPI 3 Wire)

| Characteristic | Symbol | Specification | | Unit |
|--------------------------------|----------------|-------------------|------|------|
| | | Min. | Max. | |
| Chip select setup time | CSX | t _{css3} | 10 | – |
| Chip select hold time | | t _{csh3} | 10 | – |
| Chip select "High" pulse width | | t _{chw3} | 20 | – |
| Write cycle time | SCL (Write) | t _{wc3} | 20 | – |
| SCL "High" period (Write) | | t _{wrh3} | 10 | – |
| SCL "Low" period (Write) | | t _{wrl3} | 10 | – |
| Read cycle time | SCL (Read) | t _{rc3} | 100 | – |
| SCL "High" period (Read) | | t _{rdh3} | 50 | – |
| SCL "Low" period (Read) | | t _{rdl3} | 50 | – |

2.4 MIPI Characteristics

2.4.1 DC Characteristics for MIPI DSI

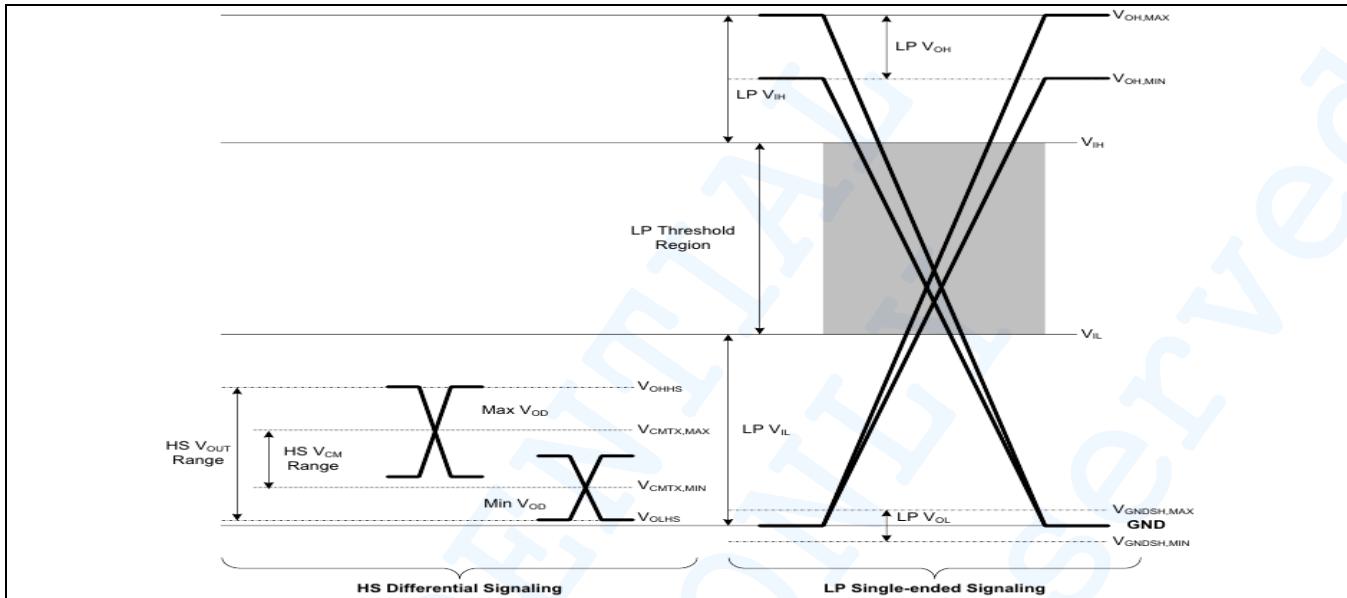

Figure 6 MIPI D-PHY Signaling Levels

Table 16 MIPI DSI DC Characteristic

| Item | | Symbol | Min. | Typ. | Max. | Unit | Note |
|-------|--|----------------|------|------|------|----------|------|
| HS_RX | Differential input high threshold | V_{IDTH} | — | — | 70 | mV | |
| | Differential input low threshold | V_{IDTL} | -70 | — | — | | |
| | Single-ended input high voltage | V_{IHHS} | — | — | 460 | | |
| | Single-ended input low voltage | V_{ILHS} | -40 | — | — | | |
| | Single-ended threshold for HS termination enable | $V_{TERM-EN}$ | — | — | 450 | | |
| | Common-mode voltage HS receive mode | $V_{CMRX(DC)}$ | 70 | — | 330 | | 1 |
| | Differential input impedance | Z_{ID} | 80 | 100 | 125 | Ω | 2 |
| LP_RX | Logic0 voltage not in ULP State | V_{IL} | — | — | 550 | mV | |
| | Logic1 input voltage | V_{IH} | 880 | — | — | | |
| | I/O leakage current | I_{LEAK} | -10 | — | 10 | μA | |
| LP_TX | Thevenin output low level | V_{OL} | -50 | — | 50 | mV | |
| | Thevenin output high level | V_{OH} | 1.1 | — | 1.3 | V | |
| | Output impedance of LP transmitter | Z_{OLP} | 110 | — | — | Ω | 2 |

NOTE:

- $V_{CMRX(DC)} = (V_{DP} + V_{DN})/2$
- COG resistance is excluded (contact resistance and ITO wiring resistance). The values are tentative.

2.4.2 MIPI Line Contention Detection

The Low-Power receiver and a separate contention detector shall be used in a bi-directional data Lane to monitor the line voltage on each low-power signal. The low-power receiver shall be used to detect an LP high fault when the LP transmitter is driving high and the pin voltage is less than V_{IL} . The contention detector shall be used to detect an LP low fault when the LP transmitter is driving low and the pin voltage is greater than V_{IHCD} . An LP low fault shall not be detected when the pin voltage is less than V_{ILCD} .

The LP-CD threshold voltages (V_{ILCD} and V_{IHCD}) are shown along with the normal signaling voltages as below. After contention has been detected, the protocol shall take proper measures to resolve the situation.

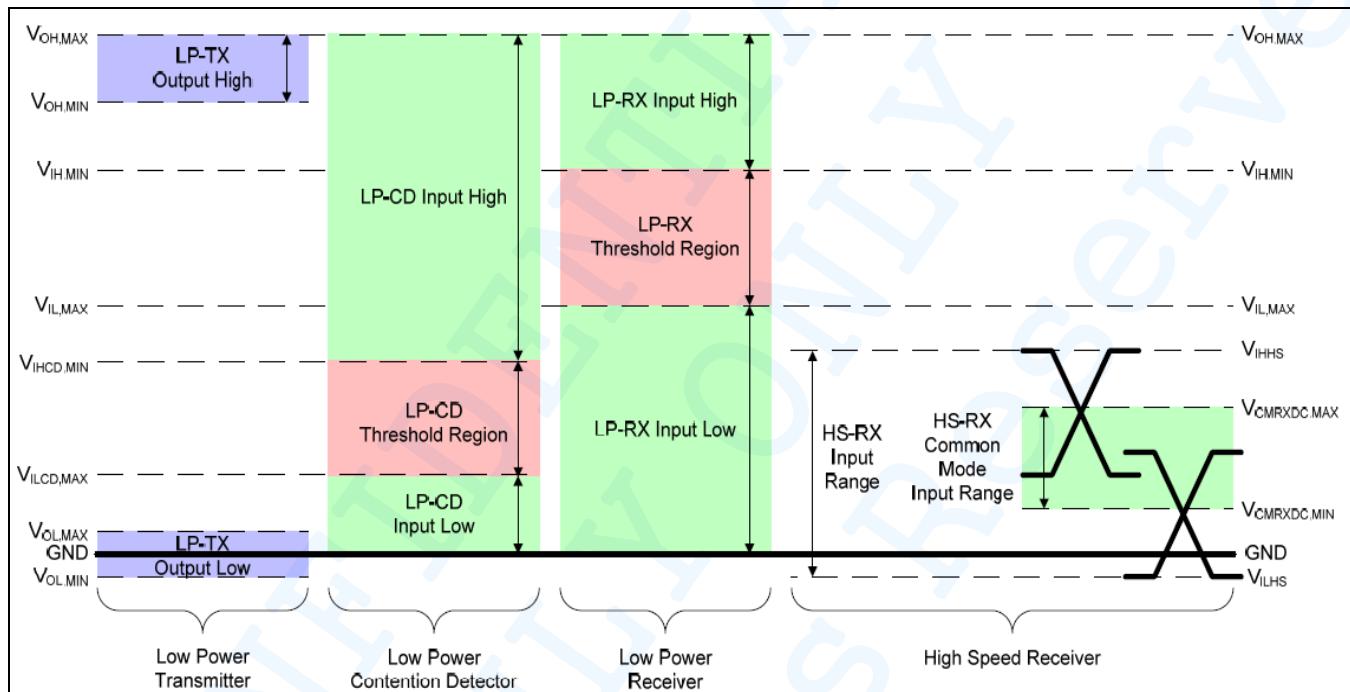

Figure 7 Signaling and Contention Voltage Levels

Table 17 MIPI Contention Detector (LP-CD) DC Characteristic

| | Item | Symbol | Min. | Typ. | Max. | Unit | Note |
|-------|-----------------------------|------------|------|------|------|------|------|
| CD_RX | Logic0 contention threshold | V_{ILCD} | — | — | 200 | mV | |
| | Logic1 contention threshold | V_{IHCD} | 450 | — | — | | |

2.4.3 MIPI DSI High-Speed RX Clock and Data-Clock Timing

The timing relationship of the DDR Clock differential signal to the Data differential signal is shown in following figure. Data is launched in a quadrature relationship to the clock such that the Clock signal edge may be used directly by the receiver to sample the received data.

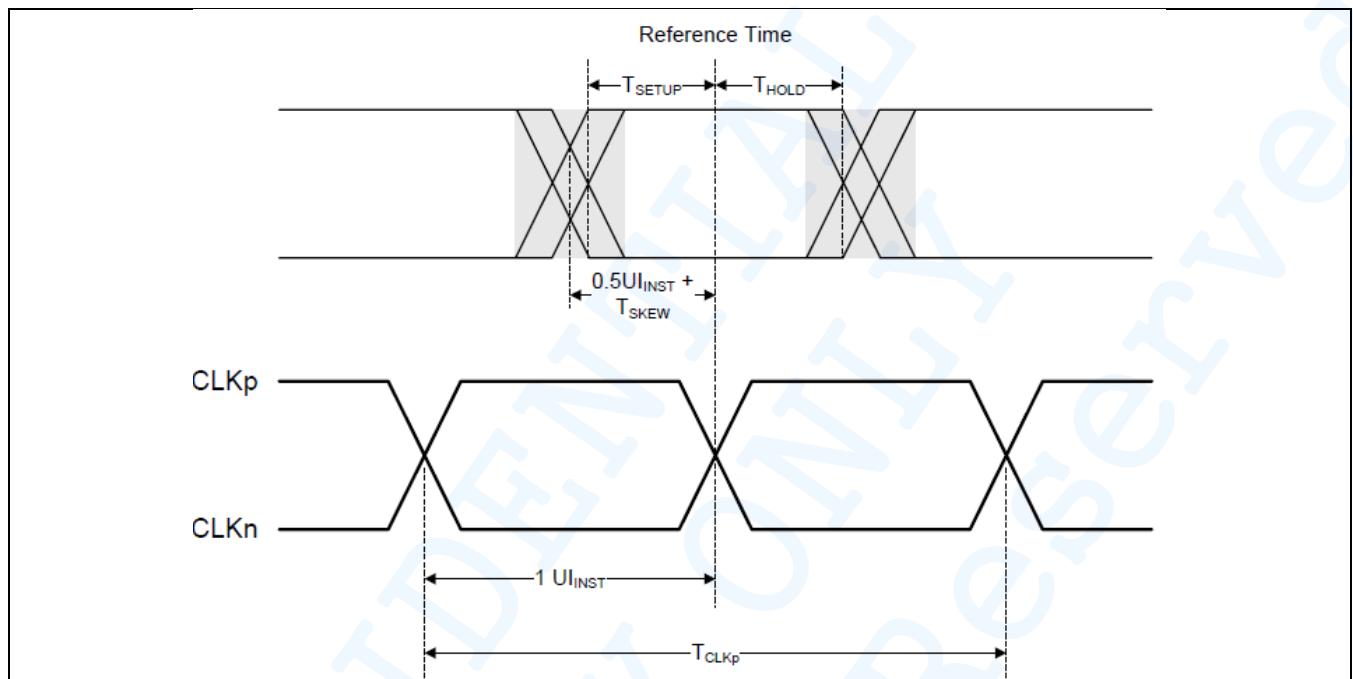

Figure 8 Data to Clock Timing Definitions

Table 18 Data to Clock Signal Specifications

| Parameter | Symbol | Condition | Min. | Typ. | Max. | Unit | Note |
|--------------------------|----------------|-----------|-------|------|------|-------------|-------|
| DSI Data Transfer Rate | T_{DSIR} | | 80 | | 500 | Mbps | |
| Data to Clock Skew | $T_{SKEW[TX]}$ | | -0.15 | | 0.15 | UI_{INST} | 3 |
| Data to Clock Setup time | T_{SETUP} | | 0.15 | — | — | UI_{INST} | 1,2 |
| Data to Clock Hold time | T_{HOLD} | | 0.15 | — | — | UI_{INST} | 1,2,4 |
| UI instantaneous | UI_{INST} | | 2 | — | 12.5 | ns | |

NOTE:

1. Min. $T_{SETUP[Rx]}/T_{HOLD[Rx]}$ time is 0.15UI. (May change depends on DSI transfer rate)
2. $T_{SETUP[Rx]}$ and $T_{HOLD[Rx]}$ are measured without HS-TX jitter and FPC circuit.
3. Total silicon and package delay budget of 0.3* UI_{INST} .
4. Total setup and hold window for receiver of 0.3* UI_{INST} .

2.4.4 High Speed Clock and Data Timing

Below Figure shows the sequence of the high speed data transmission.

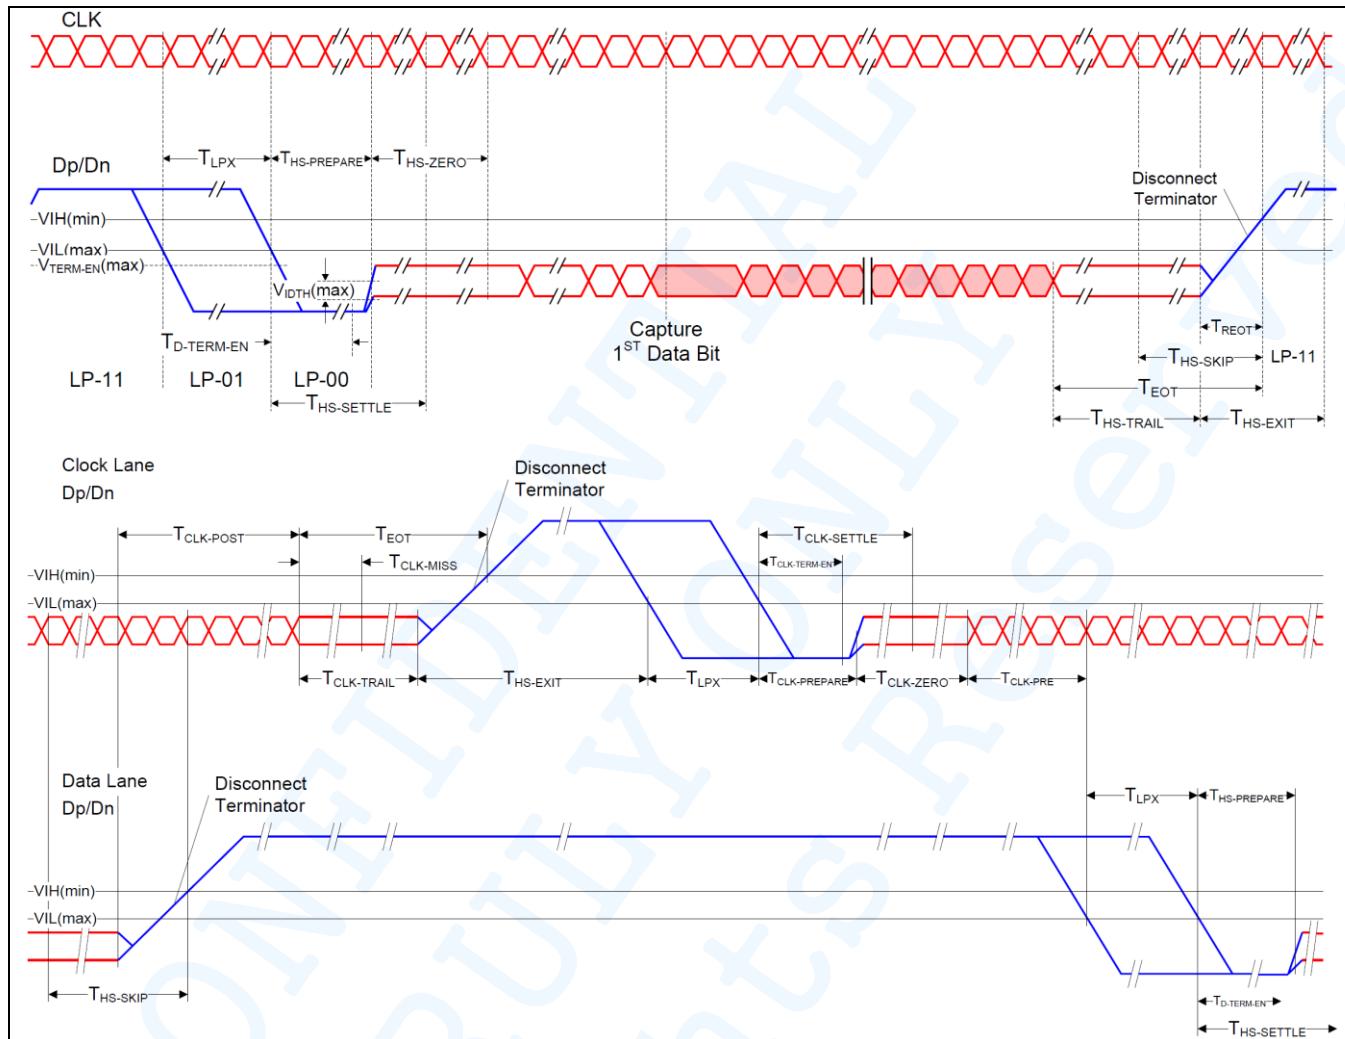

Figure 9 High Speed Clock and Data timing

The values in the following table require a clock tolerance no worse than $\pm 10\%$ for implementation.

Table 19 Global Operation Timing Parameters

| Symbol | Description | Min. | Typ. | Max. | Unit | Note |
|-----------|---|--------------------|------|------|------|------------|
| TCLK-MISS | Timeout for receiver to detect absence of Clock transitions and disable the Clock Lane HS-Rx. | — | — | 60 | ns | (1) (6) |
| TCLK-POST | Time that the transmitter continues to send HS clock after the last associated Data Lane has transitioned to LP Mode. Interval is defined as the period from the end of THS-TRAIL to the beginning of TCLK-TRAIL. | 60 ns + 52 × UI | — | — | | (5) |

SH8601Z

480x480 AMOLED Display Driver IC

| Symbol | Description | Min. | Typ. | Max. | Unit | Note |
|-------------------------------------|---|---|------|----------------------|------|-------------------|
| T _{CLK-PRE} | Time that the HS clock shall be driven by the transmitter prior to any associated Data Lane beginning the transition from LP to HS mode. | 8 | — | — | UI | |
| T _{CLK-PREPARE} | Time that the transmitter drives the Clock Lane LP-00 Line state immediately before the HS-0 Line state starting the HS transmission. | 38 | — | 95 | | |
| T _{CLK-SETTLE} | Time interval during which the HS receiver shall ignore any Clock Lane HS transitions, starting from the beginning of T _{CLK-PREPARE} . | 95 | — | 300 | | (6) |
| T _{CLK-TERM-EN} | Time for the Clock Lane receiver to enable the HS line termination, starting from the time point when Dn crosses V _{IL,MAX} . | Time for Dn to reach V _{TERM-EN} | — | 38 | ns | |
| T _{CLK-TRAIL} | Time that the transmitter drives the HS-0 state after the last payload clock bit of a HS transmission burst. | 60 | — | — | | (5) |
| T _{CLK-PREPARE + CLK-ZERO} | T _{CLK-PREPARE} + time that the transmitter drives the HS-0 state prior to starting the Clock. | 300 | — | — | | |
| T _{D-TERM-EN} | Time for the Data Lane receiver to enable the HS line termination, starting from the time point when Dn crosses V _{IL,MAX} . | Time for Dn to reach V _{TERM-EN} | — | 35 ns + 4 × UI | — | (6) |
| T _{EOT} | Transmitted time interval from the start of T _{HS-TRAIL} or T _{CLK-TRAIL} , to the start of the LP-11 state following a HS burst. | — | — | 105 ns + n × 12 × UI | — | (3) (5) |
| T _{HS-EXIT} | Time that the transmitter drives LP-11 following a HS burst. | 100 | — | — | | |
| T _{HS-PREPARE} | Time that the transmitter drives the Data Lane LP-00 Line state immediately before the HS-0 Line state starting the HS transmission | 40 ns + 4 × UI | — | 85 ns + 6 × UI | | (5) |
| T _{HS-PREPARE + HS-ZERO} | T _{HS-PREPARE} + time that the transmitter drives the HS-0 state prior to transmitting the Sync sequence. | 145 ns + 10 × UI | — | — | | |
| T _{HS-SETTLE} | Time interval during which the HS receiver shall ignore any Data Lane HS transitions, starting from the beginning of T _{HS-PREPARE} . | 85 ns + 6 × UI | — | 145 ns + 10 × UI | ns | |
| T _{HS-SKIP} | Time interval during which the HS-RX should ignore any transitions on the Data Lane, following a HS burst. The end point of the interval is defined as the beginning of the LP-11 state following the HS burst. | 40 | — | 55 ns + 4 × UI | | (6) |
| T _{HS-TRAIL} | Time that the transmitter drives the flipped differential state after last payload data bit of a HS transmission burst | Max (n × 8 × UI, 60 ns + n × 4 × UI) | — | — | | (2) (3) (5) |

SH8601Z

480x480 AMOLED Display Driver IC

| Symbol | Description | Min. | Typ. | Max. | Unit | Note |
|------------------------|--|----------------------|------|----------------------|------|------------|
| T _{LPX} | Transmitted length of any Low-Power state period | 45.5 | — | — | ns | (4) (5) |
| Ratio T _{LPX} | Ratio of T _{LPX} (MASTER)/ T _{LPX} (SLAVE) between Master and Slave side | 2/3 | — | 3/2 | — | |
| T _{TA-GET} | Time that the new transmitter drives the Bridge state (LP-00) after accepting control during a Link Turnaround. | 5 × T _{LPX} | | | ns | (5) |
| T _{TA-GO} | Time that the transmitter drives the Bridge state (LP-00) before releasing control during a Link Turnaround. | 4 × T _{LPX} | | | | |
| T _{TA-SURE} | Time that the new transmitter waits after the LP-10 state before transmitting the Bridge state (LP-00) during a Link Turnaround. | T _{LPX} | — | 2 × T _{LPX} | | |
| T _{WAKEUP} | Time that a transmitter drivers a Mark-1 state prior to a Stop state in order to initiate an exit from ULPS. | 1 | | | ms | (5) |

NOTE:

1. The minimum value depends on the bit rate. Implementations should ensure proper operation for all the supported bit rates.
2. If $a > b$ then Max. (a, b) = a, otherwise Max. (a, b) = b
3. Where n = 1 for Forward-direction HS mode and n = 4 for Reverse-direction HS mode
4. TLPX is an internal state machine timing reference. Externally measured values may differ slightly from the specified values due to asymmetrical rise and fall times.
5. Transmitter-specific parameter
6. Receiver-specific parameter

3 Functional Description

3.1 Tearing Effect Information

The Tearing Effect output line supplies a Panel synchronization signal to the external AP. This signal can be enabled or disabled by the TE control commands. SH8601Z has two TE functions. One is controlled by UCS command and the other is controlled by MCS command. The MCS TE function is superior to the UCS TE function.

3.1.1 Tearing Effect Control

TE signal is controlled by TEM (35h) and TESCAN (44h) commands. In TE Mode 1 (UCS TEON and TEM=0), the Tearing Effect output signal is generated by V-Sync information or by the only one H-Sync information designated by TESCAN. In TE Mode 2(UCS TEON and TEM=1), the Tearing Effect output signal consists of V-Sync & H-Sync information.

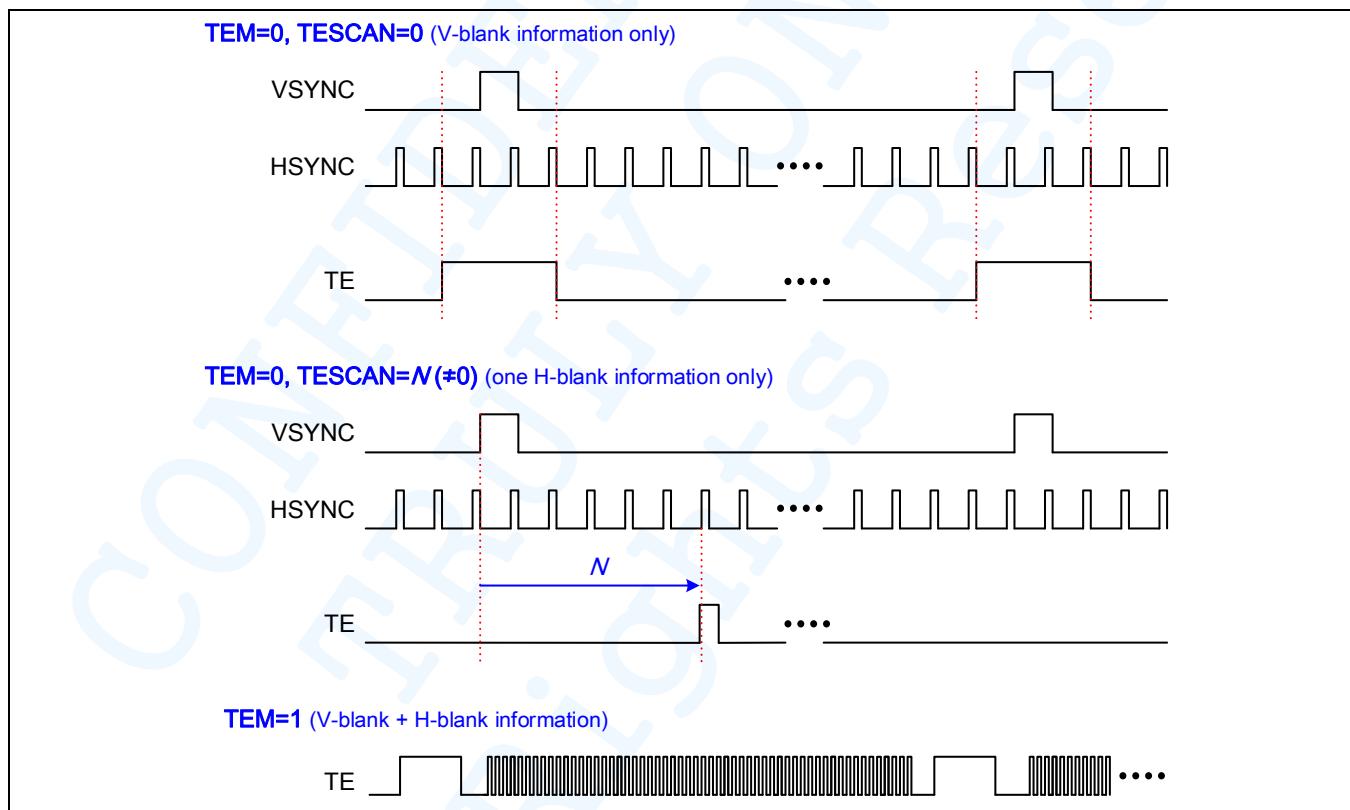

Figure 10 Tearing Effect Line Modes – by UCS

NOTE: During sleep in mode, the Tearing Effect output pin is active low.

3.1.2 Tearing Effect Line Timings

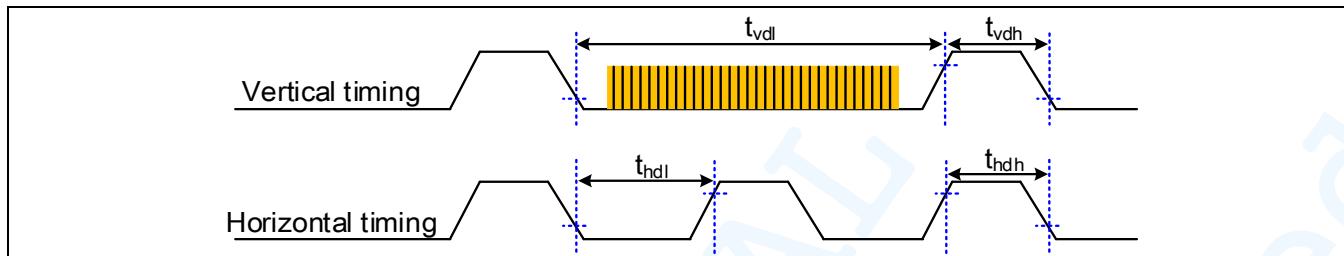

Figure 11 Tearing Effect Line Timings

Table 20 AC Characteristics of Tearing Effect Signal

| Parameter | Symbol | Specification | | | Unit | Description |
|---------------------------------|--------|---------------|------|------|-------|-------------|
| | | Min. | Typ. | Max. | | |
| Vertical timing low duration | tvdl | — | 480 | — | Line | Note2 |
| Vertical timing high duration | tvdh | — | 16 | — | Line | Note2 |
| Horizontal timing low duration | thdl | — | 480 | — | Pixel | Note2 |
| Horizontal timing high duration | thdh | — | 32 | — | Pixel | Note2 |
| Rise time | tr | — | — | 15 | ns | Note1 |
| Fall time | tf | — | — | 15 | ns | |

NOTE:

1. The signal's rise and fall times (tf, tr) are stipulated to be equal to or less than 15 ns.
2. Condition : Resolution 480x480, HACTIVE = 480 pixels, HBP = 16 pixels, HFP = 16 pixels, VACTIVE = 480 lines, VBP = 8lines, VFP = 8lines.

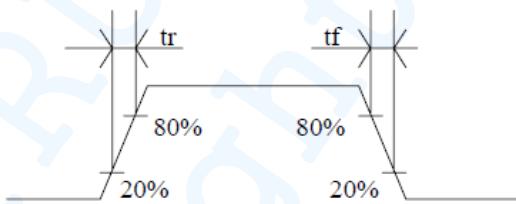

Figure 12 Rise and Fall Times

3.2 Sleep Out Command and Self-Diagnostic Functions

3.2.1 Register Loading Detection

Sleep out command is a trigger for an internal function of the display module which indicates, if the display module loading function of factory default values from OTP to registers of the display controller is working properly.

There are compared factory values of the OTP and register values of the display controller by the display controller (1st step: Compares register and OTP) values, 2nd step: Loads OTP value to register. If those both values (OTP and register values) are same, there is inverted (= increased by 1) a bit, which is defined in command "Read Display Self-Diagnostic Result (0FH)" (= RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (= not increased by 1).

The flow chart for this internal function is following.

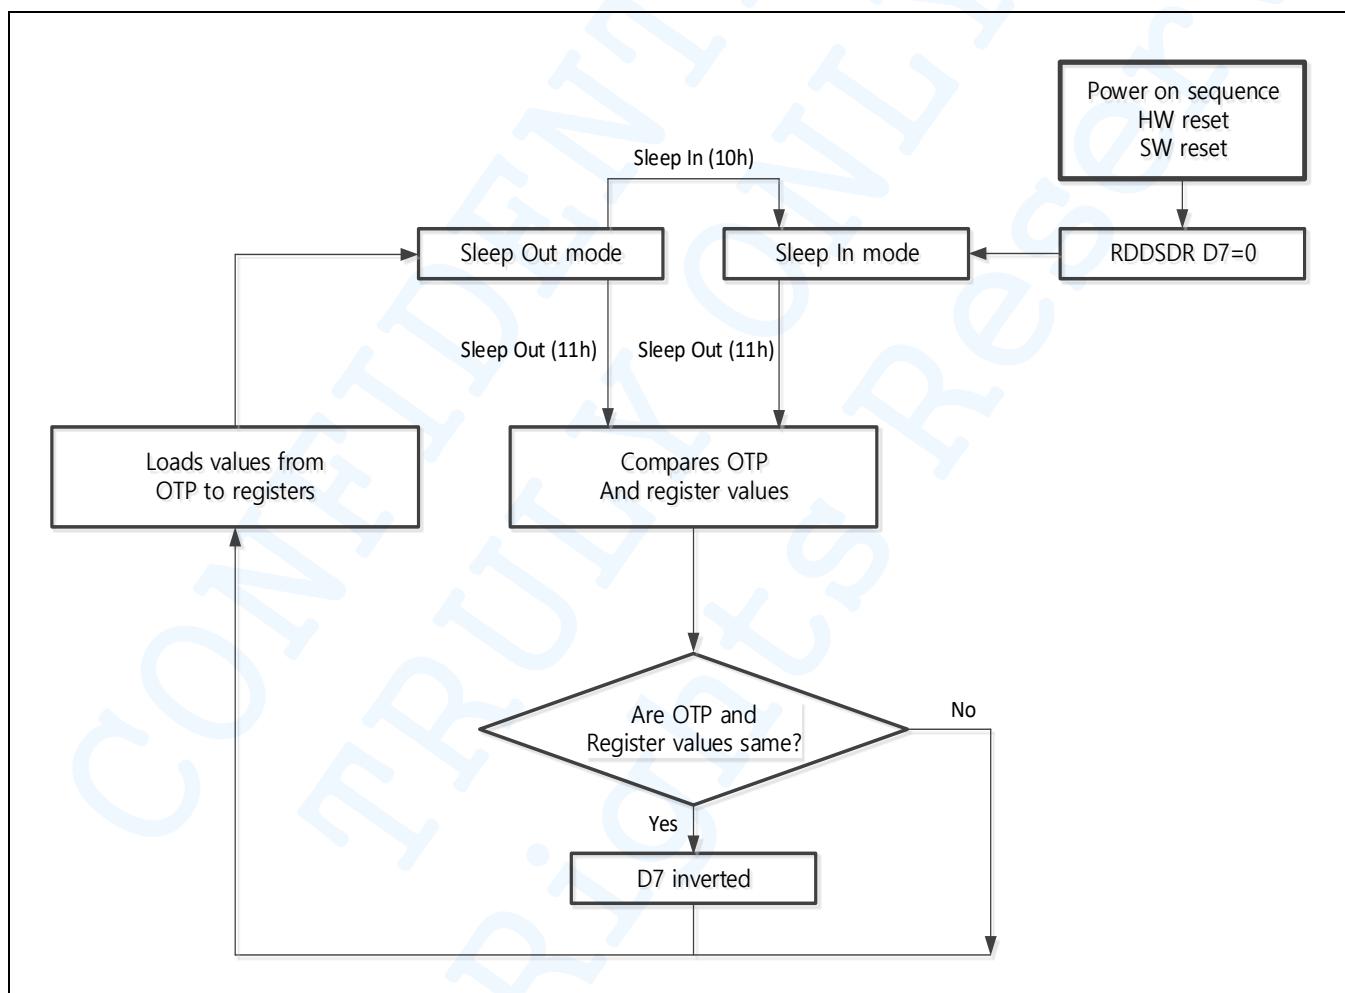

Figure 13 Flow Chart of Register Loading Detection

3.2.2 Functionality Detection

Sleep out command is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function (=the display controller) is comparing, if the display module is still meeting functionality requirements (e.g. Step up circuit voltage levels, timings, etc.). If functionality requirement is met, there is inverted (=Increased by 1) a bit, which defined in command "Read Display Self-Diagnostic Result (0FH)" (= RDDSDR) (the used bit of this command is D6). If functionality requirement is not met, this bit (D6) is not inverted (= Not increased by 1)

The flow chart for this internal function is following:

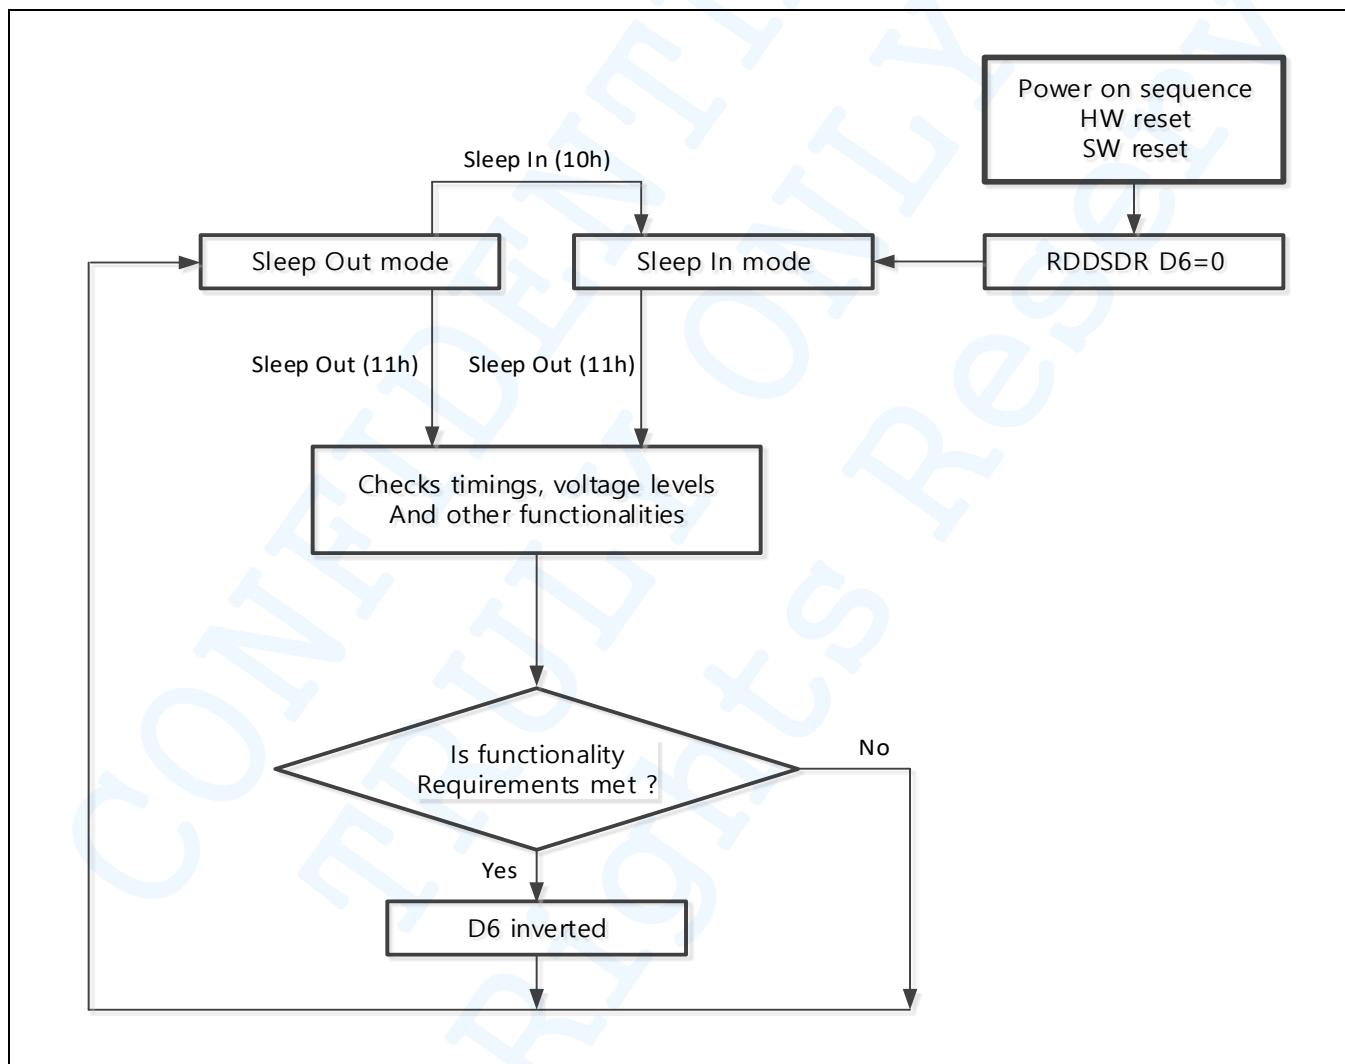

Figure 14 Flow Chart of Functionality Detection

NOTE: There is needed 150ms after sleep out command, when there is changing from Sleep in mode to sleep out mode, before there is possible to check if functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise there is 10ms delay for D6's value when Sleep out command is sent in Sleep out mode.

3.3 Power

3.3.1 Power On/Off Sequence

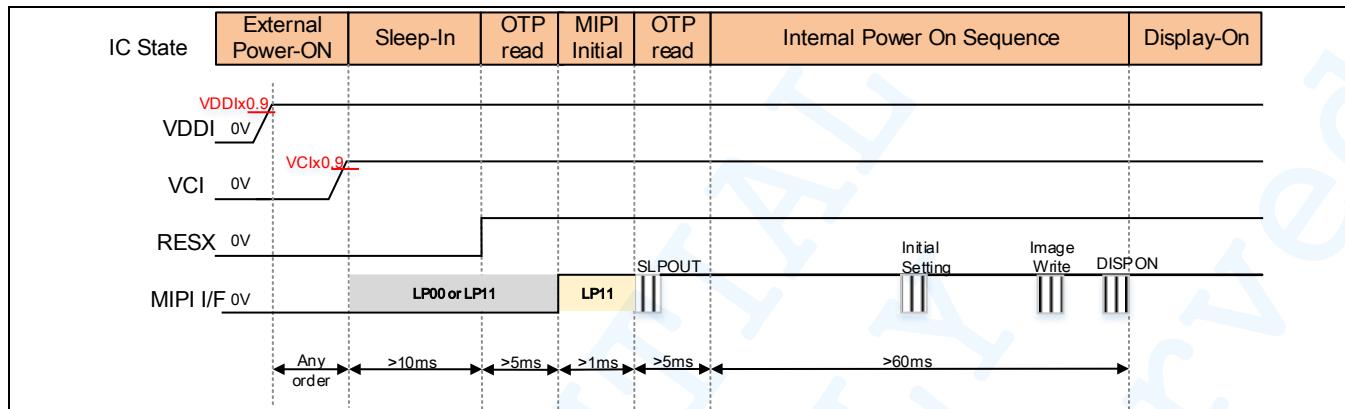

Figure 15 Power-On Sequence

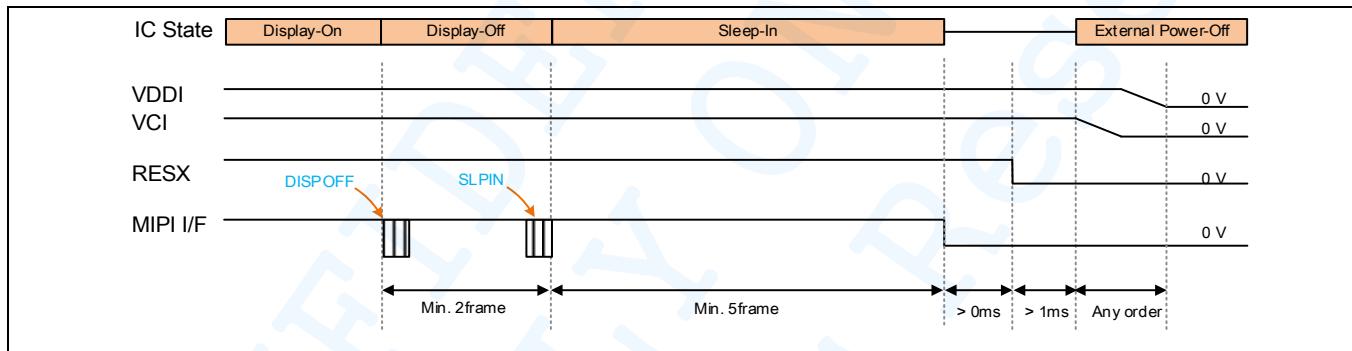

Figure 16 Power-Off Sequence

3.3.1.1 Power On to Display On / Display Off to Power Off Sequence

The power on to display-on sequence & display-off to power-off sequence are illustrated in the following figures.

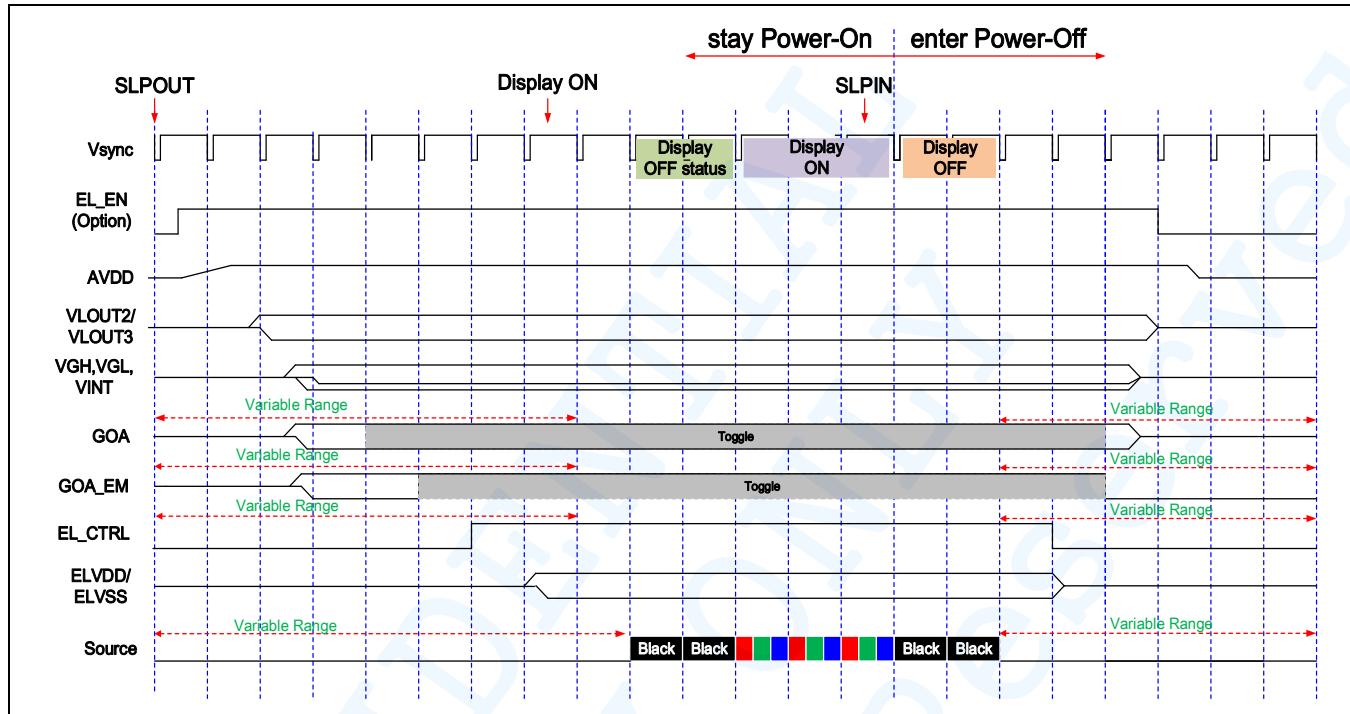

Figure 17 Power-On to Display-On & Display-Off to Power-Off Sequence

3.3.1.2 Power Ramp Up/Down

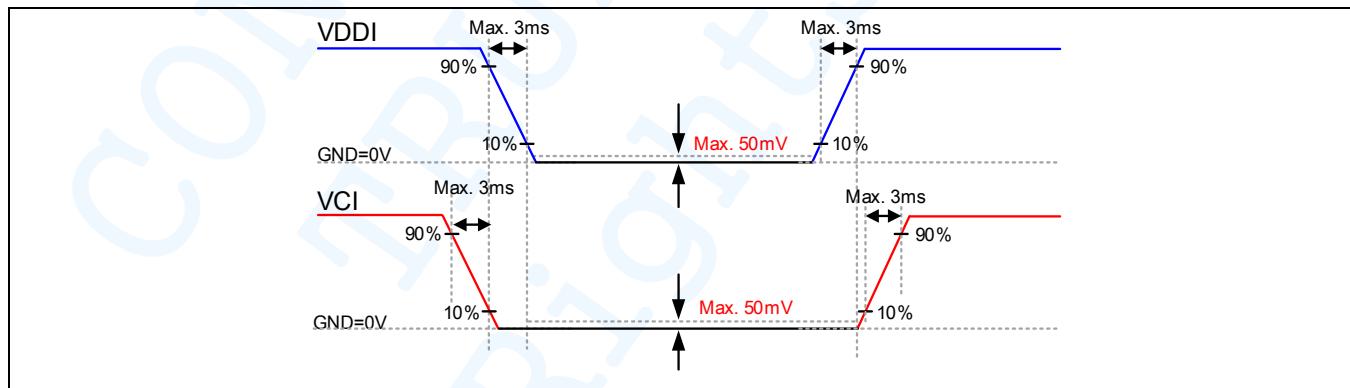

Figure 18 Power Ramp Up/Down

3.3.2 Power Levels

SH8601Z supports 4 types of power-consumption modes. Each mode is described as follows:

1. Normal Mode On (full display), Sleep Out.
In this mode, the display is able to show maximum 16,777,216 colors.
2. Sleep In Mode.
In this mode, the booster, internal oscillator and panel driver circuit are stopped.
3. DSTB Mode.
In this mode, the booster, internal oscillator and panel driver circuit are stopped.
Interface and registers are not working.
4. Power off Mode.
In this mode, VCI and VDDI are removed.

NOTE:

1. Transitions between modes 1-2 are controllable by register control.
2. Mode 3 is entered for power saving with both power supplies for I/O and analog circuits and can be exited by Hardware reset only(RESX=Low)
3. Mode 4 is entered only when both Power supplies are removed.

3.3.3 Discharge Status of Power Block and I/O PADs

Table 21 Discharge Status of Power Block and I/O PADs

| Power | After H/W or S/W Reset Sleep In Mode | Deep Standby Mode | Abrupt Power Off |

| RDCCS(AFh) | 00h | 00h | 00h |
| SPI_MODE(C4h) | 00h | 00h | 00h |
| RDID1(DAh) | (OTP values) | (OTP values) | (OTP values) |
| RDID2(DBh) | (OTP values) | (OTP values) | (OTP values) |
| RDID3(DCh) | (OTP values) | (OTP values) | (OTP values) |

NOTE: There will be no abnormal visible effects on the display when S/W or H/W Reset is applied. Internal PoR (Power-on Reset) circuit generates a reset signal within 1ms after VDDI and VCI rise up to 90% of their typical value. It is necessary to wait 5msec after Power-on reset before sending commands. this is to allow time for OTP loading.

3.6 Modules Input/output/Bi-direction (I/O) PADs

3.6.1 Output or Bi-directional (I/O) PADs

Table 23 Reset States of Output and Bi-direction PADs

| Output or Bi-directional PADs | When RESX is Low | After Power On | After Hardware Reset | After Software Reset |

4 Interface

Terminology used in this section

- Mobile Industry Processor Interface(MIPI): MIPI Alliance has defined DBI, DSI, and D-PHY
- Display Bus Interface(DBI): Type-B 8-bit / Type-C Option1 SPI3W/ Option3 SPI4W
- Dual mode in SPI3W and SPI4W (register option)
- Quad SPI: Quad serial interface
- DSI: Display serial interface. DSI is usually called as MIPI
- D-PHY: Physical layer

4.1 Interface Type Selection

Interface type is decided by input IM[2:0].

Table 25 Interface Type Selection

| IM[2:0] | Command Interface | Display Data Interface |
|----------|-------------------|------------------------|
| 000 | SPI 3-wire / MIPI | SPI 3-wire / MIPI |
| 001 | SPI 4-wire / MIPI | SPI 4-wire / MIPI |
| 010 | Quad SPI / MIPI | Quad SPI / MIPI |
| 011, 100 | MPU 8-bit | MPU 8-bit |
| 101 | SPI 3-wire | SPI 3-wire |
| 110 | SPI 4-wire | SPI 4-wire |
| 111 | MIPI | MIPI |

In-Out pad mapping for each interface mode is shown below.

MPU I/F

4.2 MIPI DBI Type-B and Type-C Interface Configuration

SH8601Z driver IC supports parallel interface DBI Type-B. 8bits data transmitted from Host to SH8601Z driver IC. And supports serial interface DBI Type-C (Option1 and Option3). 8/9bits data transmitted from Host to SH8601Z driver IC. It is possible to suspend data transfer if the Chip select(CSX) and clock signal (WRX or SCL) are held in their current state until data transfer can resume. Host can read SH8601Z register value from DB[7:0] or SDIA(or SDO) output. Also SH8601Z can support Quad SPI mode.

4.3 MIPI DBI Interface Data Transfer Ignore and Pause

SH8601Z stores the command/parameters into the register file. The command and parameters transferred from Host Application processor (AP) to SH8601Z are stored in the register file of SH8601Z before transmission break occurred. e.g.) such as CSX to "High" during data transmission. If transmission break is occurred before the last parameter is transmitted, only the last transmitted parameters are stored. If a new command is transferred before the last parameter is done, SH8601Z begins to store a new parameter. And previous left parameters are ignored even they are resent. SH8601Z does not support data transmission pause operation during Write/Read sequence.

4.4 MIPI DBI Type-B (MPU 8bit) Interface

In MIPI DBI Type-B interface, SH8601Z supports 8-bit interface mode. Register write-read timing diagram is shown below. Using this mode, user also can send RGB image data with command 0x2C and 0x3C.

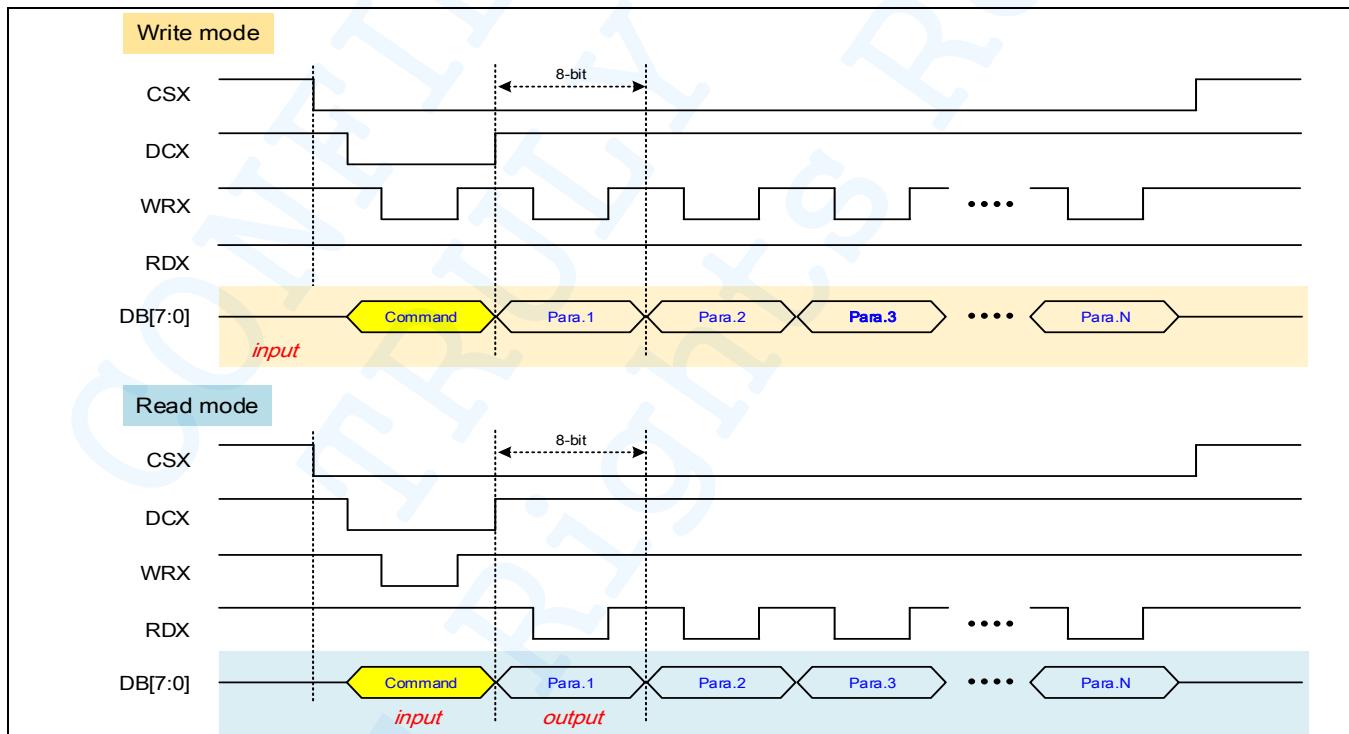

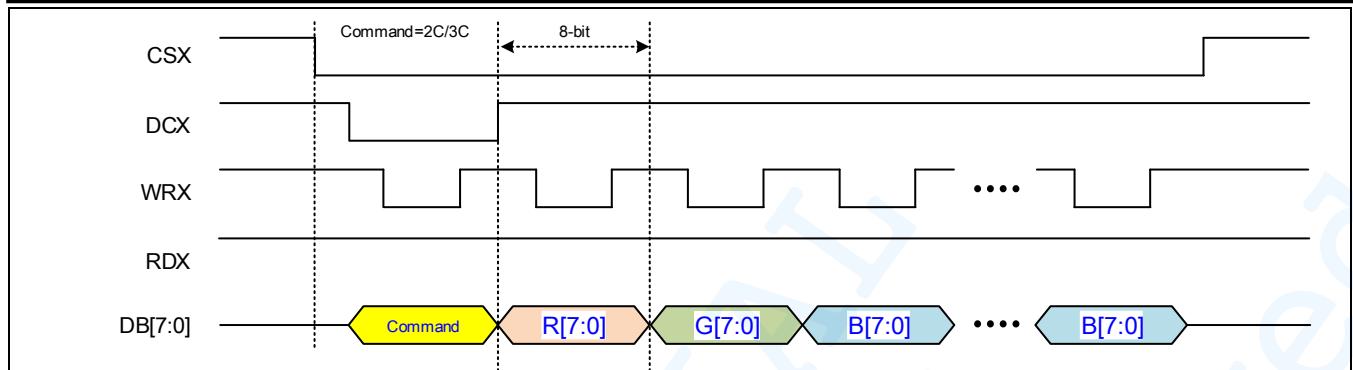

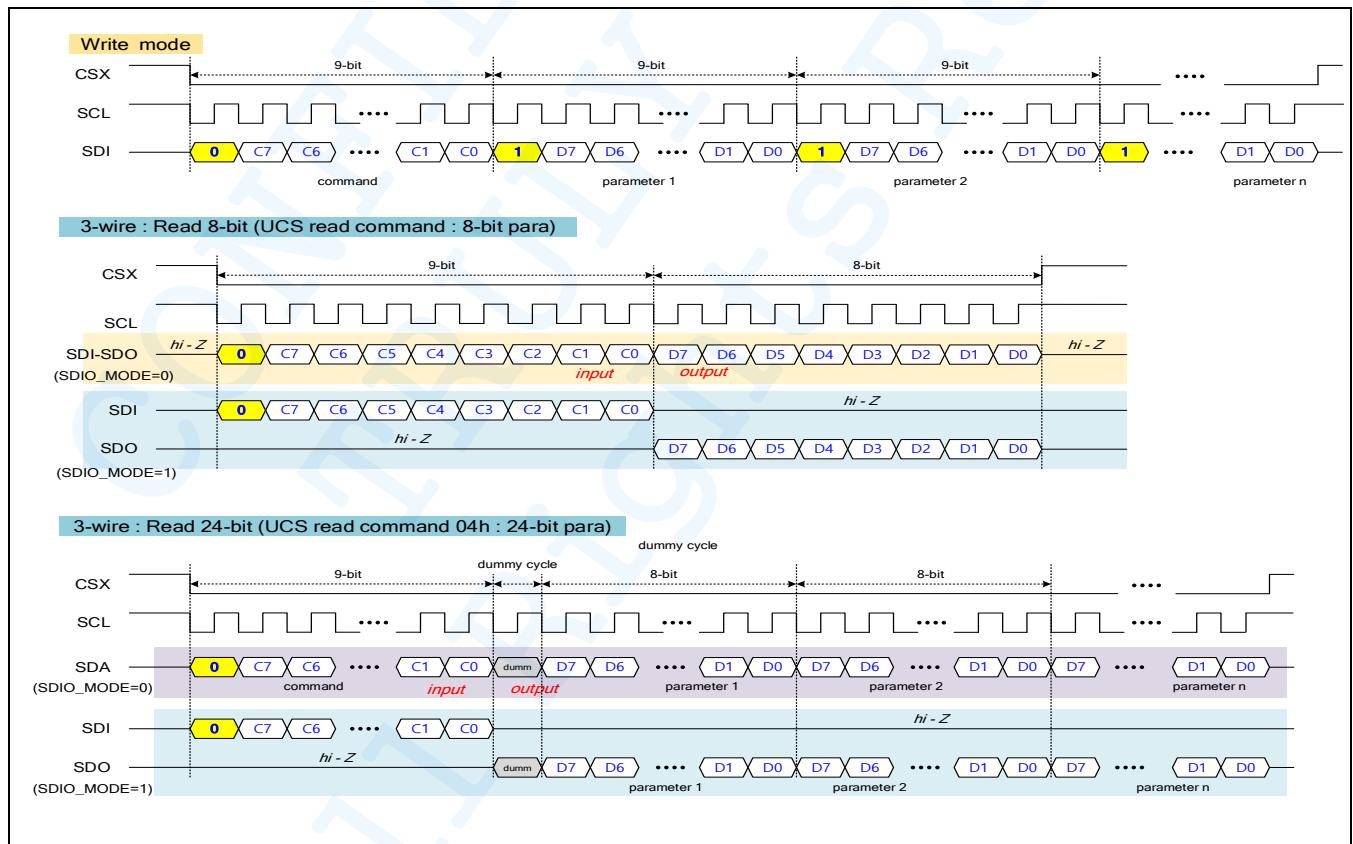

Figure 22 MPU 8-bit Interface Protocol – Register Read and Write

Figure 23 MPU 8-bit Interface – Pixel Interface

4.5 MIPI DBI Type-C (3-Wire 9-Bit) Interface

This serial interface is MIPI DBI Type-C (3-wire 9-bit) bi-directional interface for communication between the Host Application Processor (AP) and the SH8601Z. CSX, SCL, SDIO (or SDI, SDO) are used for interface with AP only, so it can be stopped when communication is not necessary. In read protocol, SDIO or SDI+SDO condition is decided by register SDIO_MODE setting in command SPI_MODE(C4h). UCS read is divided into 8 bit para mode and 24 bit para mode. MCS read is the same as the 24 bit para mode of UCS, but SPI_READ should be set to '1' with the command SPI_RDON (47h). SPI_READ must be reset to '0' with the command SPI_RDOFF (46h).

Figure 24 MIPI DBI Type-C Interface – Register Write and Read

4.6 MIPI DBI Type-C (4-Wire 8-Bit) Interface

This serial interface is MIPI DBI Type-C (4-wire 8-bit) bi-directional interface for communication between the Host Application Processor (AP) and the SH8601Z. CSX, DCX, SCL, SDIO (or SDI, SDO) are used for interface with AP only, so it can be stopped when communication is not necessary. In read protocol, SDIO or SDI+SDO condition is decided by register SDIO_MODE setting in command SPI_MODE(C4h). UCS read is divided into 8 bit para mode and 24 bit para mode. MCS read is the same as the 24 bit para mode of UCS, but SPI_READ should be set to '1' with the command SPI_RDON (47h). SPI_READ must be reset to '0' with the command SPI_RDOFF (46h).

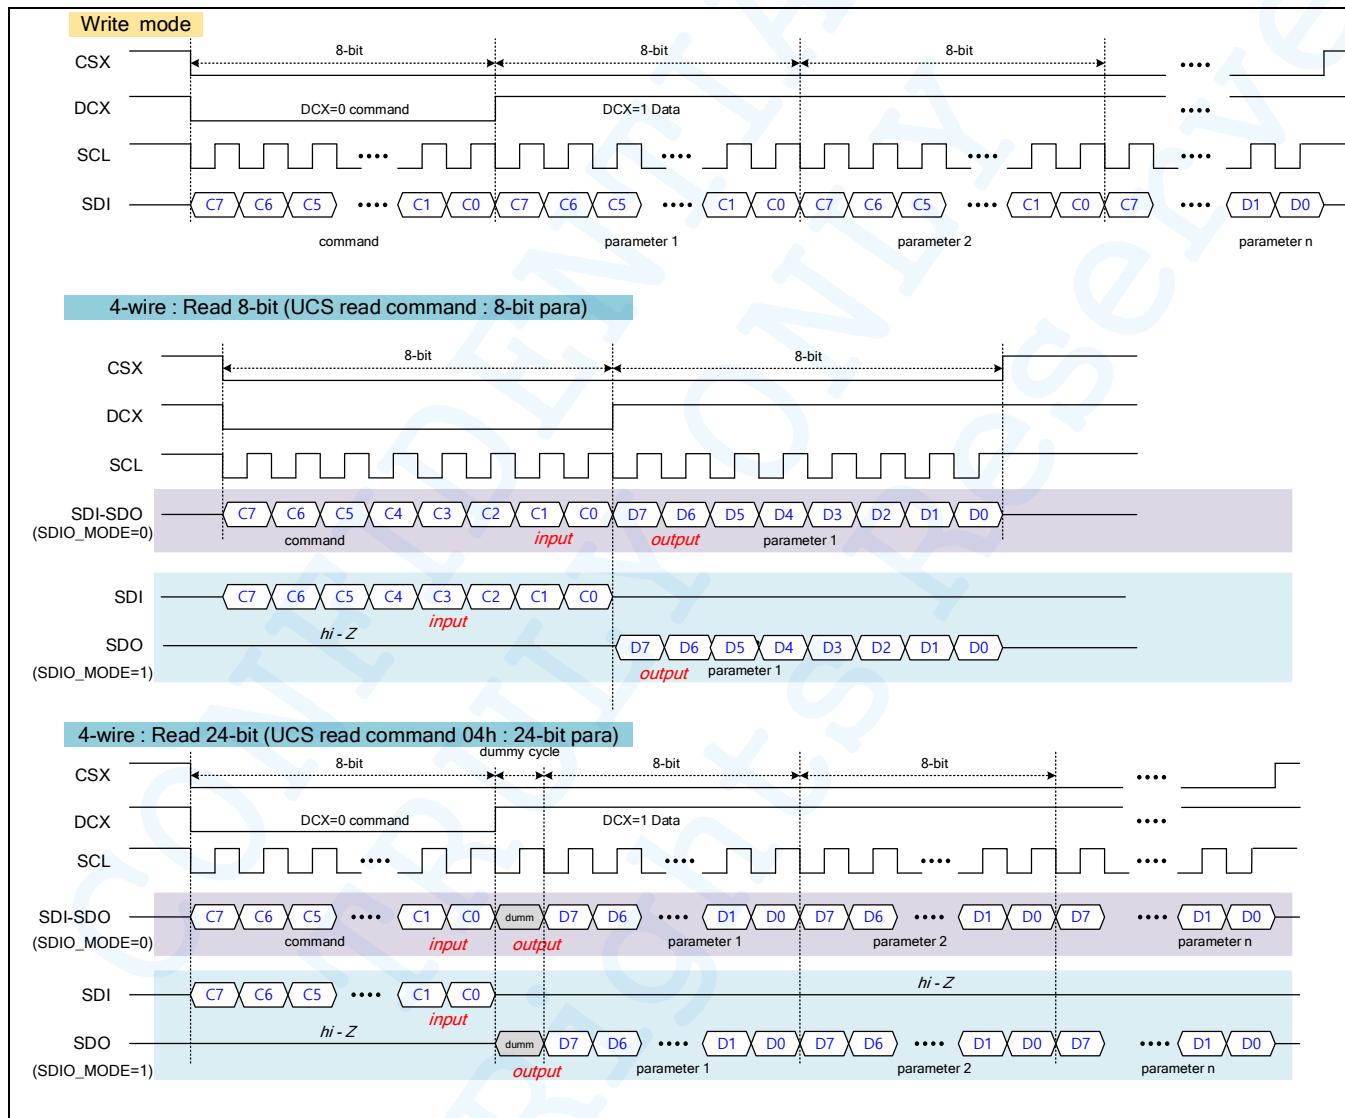

Figure 25 MIPI DBI Type-C (4-Wire 8-Bit) Interface Protocol – Register Write and Read

4.7 SPI Pixel Format

This interface is optional for SPI 3-wire and SPI 4-wire to send RGB image data. All of RGB image transfer formats are explained below. Transfer types 1P/1T 1 line, 1P/1T 2 line, and 2P/3T 2 line are selected by register SPI_MODE(C4h).

4.8 Quad SPI Interface

In addition to MIPI DBI Type-C interface, SH8601Z supports Quad-SPI interface. Register read, write interface and RGB pixel interface timing diagrams are shown below. 1-wire or 4-wire option is selected by register SPI_MODE(C4h).

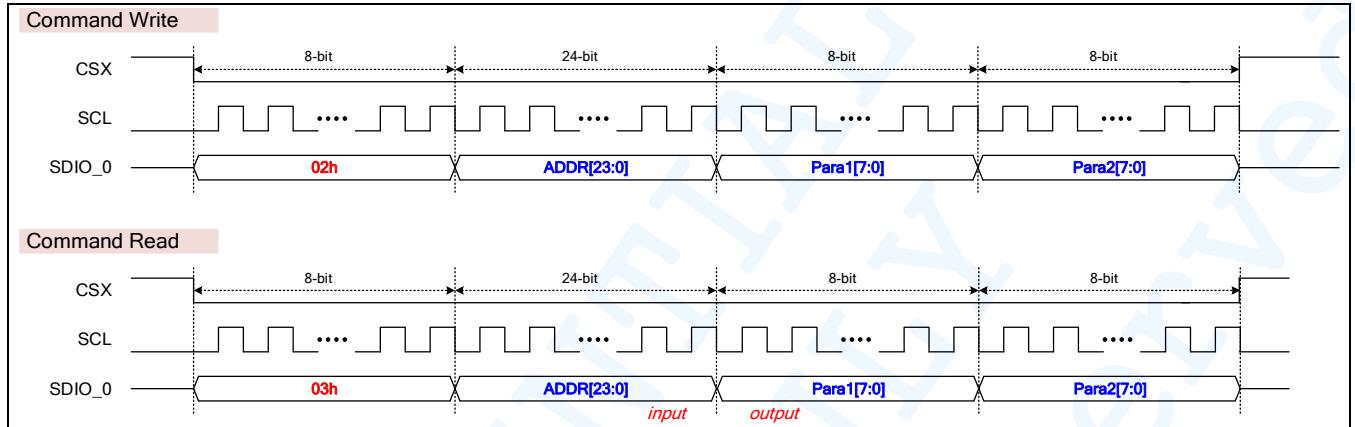

Figure 34 Quad SPI Interface Protocol – Register Read and Write

4.9 Extra Pixel Format for SPI Interface

SH8601Z supports various pixel formats through SPI interface. Target pixel format is decided by IFPF in COLMOD(0x3A). For 111, 332, and 256-gray pixel formats, SPI transfer RGB image data using register write command (0x2C or 0x3C), not RGB image interface. 8-bit data format for this interface is shown below.

| SPI 1-1-1 | | | | | | | | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Figure 39 SPI Extra RGB Pixel Format

NOTE:

1. In the SPI3W/SPI4W interface mode, the extra pixel format is only supported by single mode (DUAL_EN = 0).
2. In the QSPI interface mode, the extra pixel format is only supported by 1-wire mode.

4.10 MIPI DSI

MIPI (Mobile Industry Processor Interface) DSI (Display Serial Interface) standard defines protocols between a Host (Application Processor) and Client peripheral devices that adhere to MIPI Alliance standards for mobile device interfaces. The DSI standard builds on existing standards by adopting pixel formats and command set defined in MIPI Alliance standards. It builds on existing MIPI Alliance specifications by adopting pixel formats and command set specified in DPI-2, DBI-2 and DCS standards. Figure58 shows a simplified DSI interface configuration. From a conceptual viewpoint, a DSI-compliant interface performs the same functions as interfaces based on DBI-2 and DPI-2 standards or similar parallel display interfaces. It sends pixels or commands to the peripheral, and can read back status or pixel information from the peripheral. The main difference is that DSI serializes all pixel data, commands, and events that, in traditional or legacy interfaces, are normally conveyed to and from the peripheral on a parallel data bus with additional control signals. From a system or software point of view, the serialization and deserialization operations should be transparent. The most visible, and unavoidable, consequence of transformation to serial data and back to parallel is increased latency for transactions that require a response from the peripheral. For example, reading a pixel from the frame buffer on a display module has a higher latency using DSI than DBI. Another fundamental difference is the host processor's inability during a read transaction to throttle the rate, or size, of returned data.

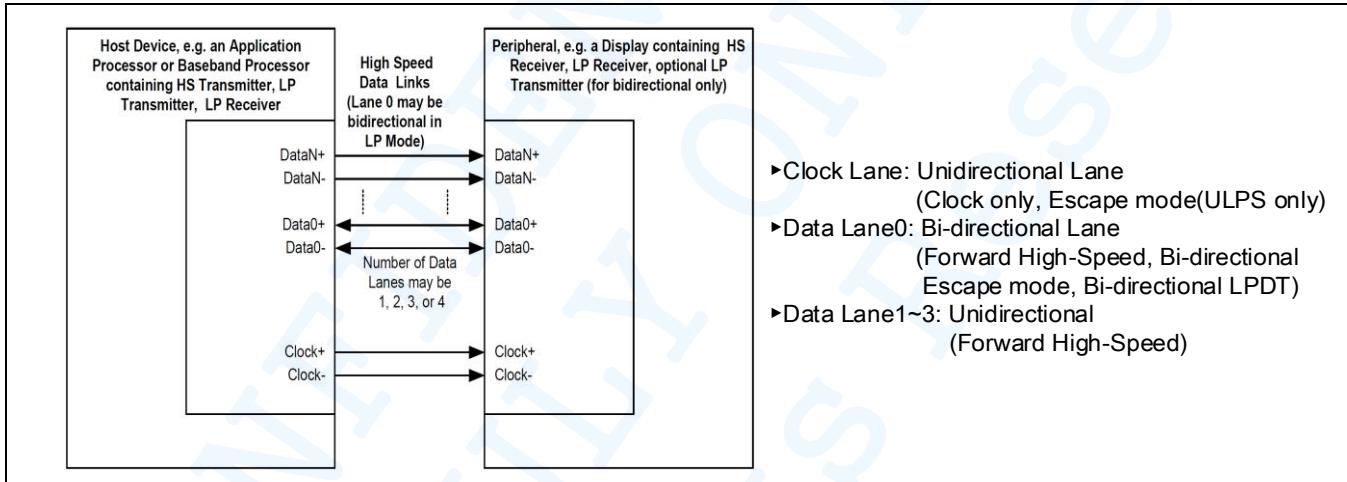

Figure 40 DSI Tx and Rx Interface Configuration

4.10.1 DSI Feature

- Support One Data lane and Clock lane.
- High speed(HS) transmissions(uni-direction) and Low Power(LP) transmission(bi-direction)
- Clock lane supports ULPS mode
- Support Command and Video mode
- Support Tearing effect (TE) signal
- Diagnostic function - Checksum and ECC error
- Functionality supported by Escape mode
- Packet-Based Protocol

| Date | Sep 22, 2009 | Oct 20, 2010 |

4.10.2 DSI Layer Definitions

A conceptual view of DSI organizes the interface into several functional layers. A description of the layers follows and is also shown in Figure 25 and it consists of 4 types such as Application Layer, Low level protocol Layer, Lane management Layer and PHY Layer.

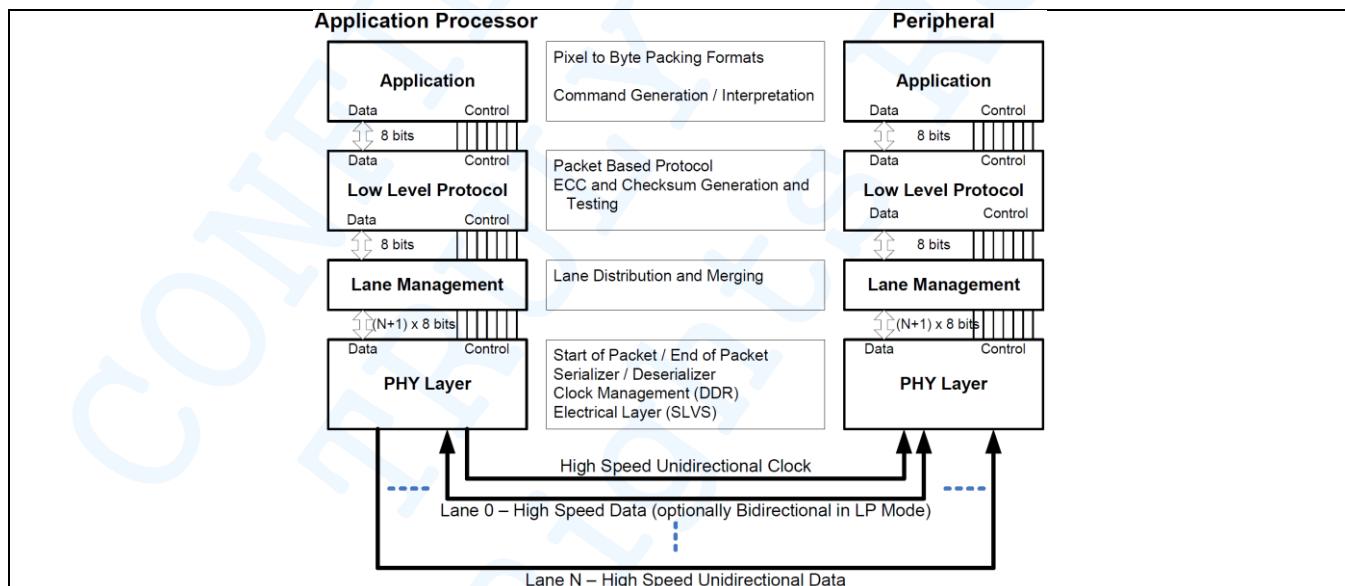

Figure 41 MIPI DSI Layers

4.10.3 Command and Video Mode

DSI-compliant peripherals support either of two basic modes of operation, Command mode and Video mode. The mode used depends on the architecture and capabilities of the peripheral. The mode definitions reflect the primary intended use of DSI for display interconnect, but are not intended to restrict DSI from operating in other

applications. Typically, a peripheral is capable of Command mode operation or Video mode operation. Some Video mode display modules also include a simplified form of Command mode operation in which the display module may refresh its screen from a reduced-size, or partial, frame buffer, and the interface (DSI) to the host processor may be shut down to reduce power consumption.

4.10.4 DSI Physical Layer (D-PHY)

The D-PHY provides a synchronous connection between master and slave. A practical PHY configuration consists of a clock signal and one or more data signals. The clock signal is unidirectional, originating at the master and terminating at the slave. The data signals can be either unidirectional or bi-directional, depending on the selected options. For half-duplex operation, the reverse direction bandwidth is one-fourth of the forward direction bandwidth. Token passing is used to control the communication direction of the link.

4.10.4.1 Lane State Definition

Display module uses data and clock lane differential pairs for DSI. Both differential lane pairs can be driven Low Power(LP) mode or High Speed(HS) mode. The State Codes of the High Speed(HS) mode and Low Power(LP) mode lane pair are defined Table 27. All LP state periods shall be at least T_{LPX} in duration. State transitions shall be smooth and exclude glitch effects. A clock signal can be reconstructed by exclusive-ORing the Dp and Dn Lines.

Table 30 MIPI Lane State Description

| State Code | Line Voltage Levels | | High-Speed | Low-Power | |
|------------|---------------------|---------|----------------|--------------|-------------|
| | Dp-Line | Dn-Line | Burst Mode | Control Mode | Escape Mode |
| HS-0 | HS Low | HS High | Differential-0 | N/A | N/A |
| HS-1 | HS High | HS Low | Differential-1 | N/A | N/A |
| LP-00 | LP Low | LP Low | N/A | Bridge | Space |
| LP-01 | LP Low | LP High | N/A | HS-Rqst | Mark-0 |
| LP-10 | LP High | LP Low | N/A | LP-Rqst | Mark-1 |
| LP-11 | LP High | LP High | N/A | Stop | N/A |

NOTE:

1. During High-Speed transmission the Low-Power Receivers observe LP-00 on the Lines.
2. If LP-11 occurs during Escape mode the Lane returns to Stop state (Control Mode LP-11)

4.10.4.2 Global Operation Flow Diagram

Below figure shows the operational flow diagram for a Data Lane Mode. Within both Tx and Rx four main processes can be distinguished: High-Speed Transmission, Escape mode, Turnaround and Initialization.

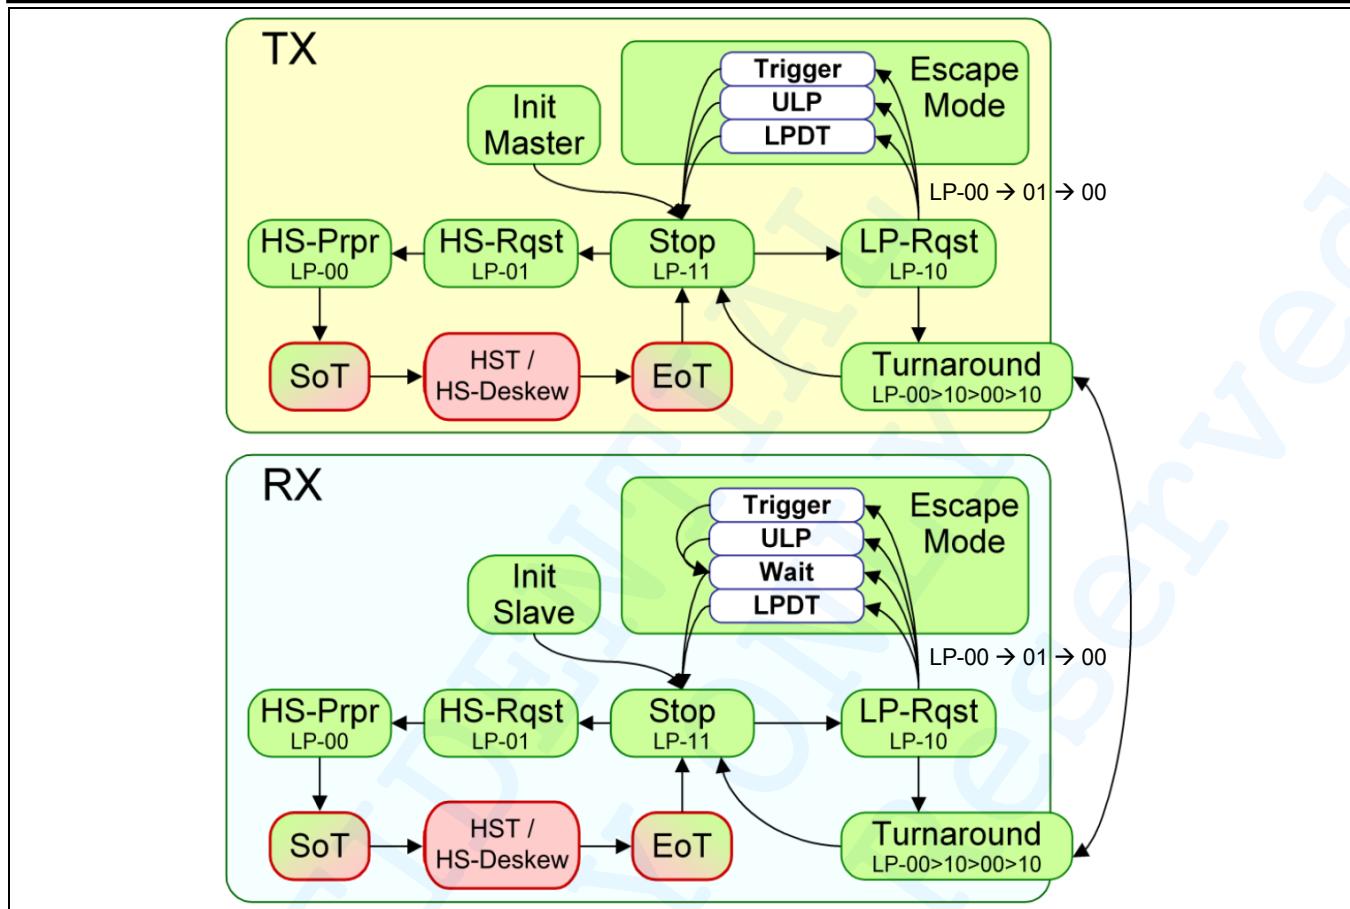

Figure 42 MIPI PHY Data Lane Mode State Diagram

4.10.4.3 Clock Lane Mode State Diagram

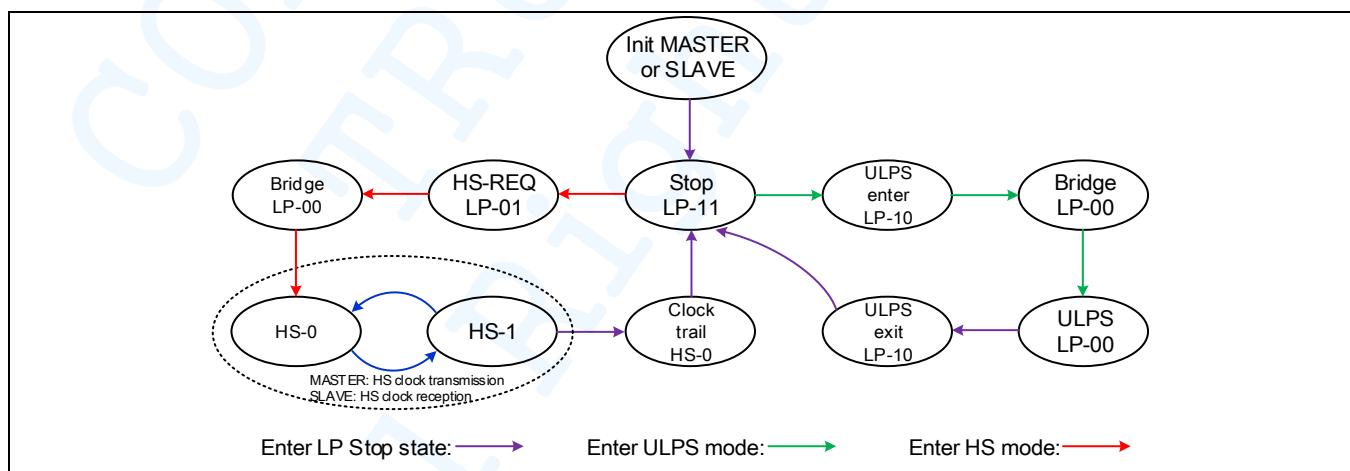

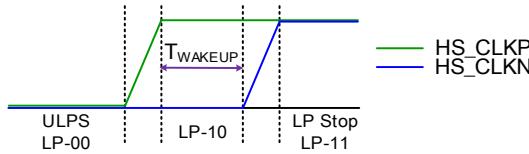

Figure 43 Clock Lane Module State Diagram

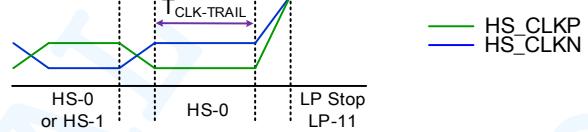

4.10.4.3.1 Clock Lane Switching

(1) After SW/HW Reset or during Power ON, Clock lane and all data lanes must be in LP-11 status.

(2) Exit Ultra Low Power State(ULPS) : LP00→LP10→LP11

(3) Exit HS clock transmission: HS-0 or HS-1→HS-0→LP11

(4) Enter Ultra Low Power State(ULPS) : LP11→LP10→ULPS LP-00 (5) Enter HS clock transmission: LP-11→LP-01→LP-00→HS-0/1

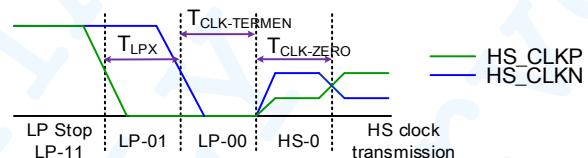

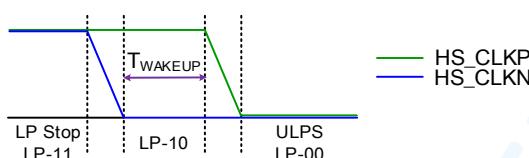

Figure 44 Clock Lane Switching State Diagram

4.10.4.4 HS (High Speed) Data Transmission Burst

The [Figure 45](#) shows the sequence of events during the transmission of a Data Burst. Transmission can be started and ended independently for any Lane by the protocol. However, for most applications the Lanes will start synchronously but may end at different times due to an unequal amount of transmitted bytes per Lane.

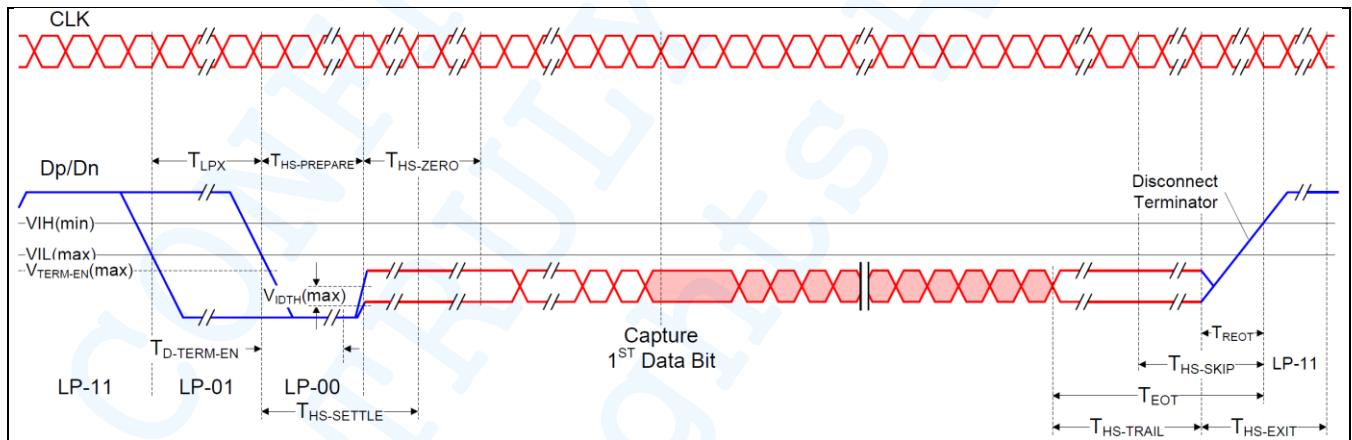

Figure 45 High-Speed Data Transmission in Bursts

4.10.4.5 High Speed Clock Transmission

The [Figure 46](#) shows the sequence of the high speed clock transmission. In high speed mode the clock lane provides a low-swing differential DDR clock signal from Master to Slave for high speed data transmission.

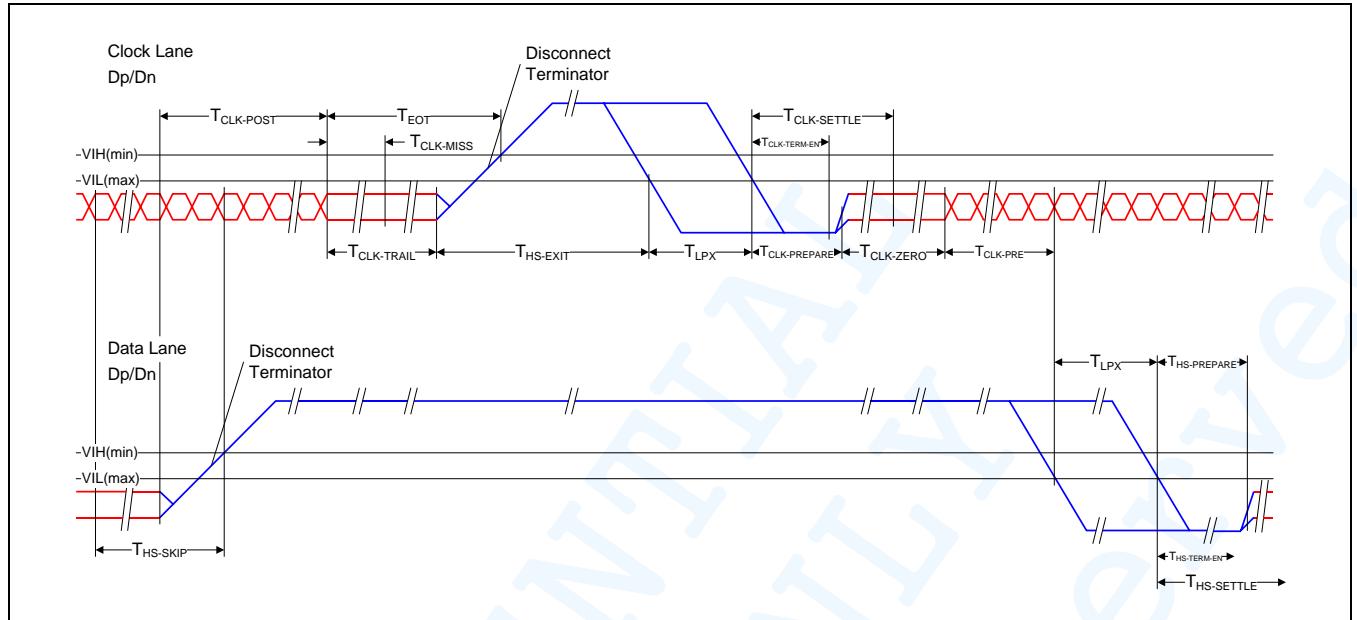

Figure 46 Switching the Clock Lane Between Clock Transmission and Low-Power Mode

4.10.4.6 Bi-Directional Data Lane Turnaround

The transmission direction of a bi-directional Data Lane can be swapped by means of a Link Turnaround procedure. This procedure enables information transfer in the opposite direction of the current direction. The procedure is the same for either a change from Forward-to-Reverse direction or Reverse-to-Forward direction. Master and Slave side shall not be changed by Turnaround. Link Turnaround shall be handled completely in Control mode. The low power clock timing for both sides of the Link does not have to be the same, but may differ. However, the ratio between the Low Power State Periods, T_{LPX} is constrained to ensure proper Turnaround behavior. The T_{LPX} (master)/ T_{LPX} (slave) shall be between 2/3 (0.667) and 3/2 (1.50). The handshake process for BTA allows only limited mismatch of Escape Mode clock frequencies between a host processor and a peripheral.

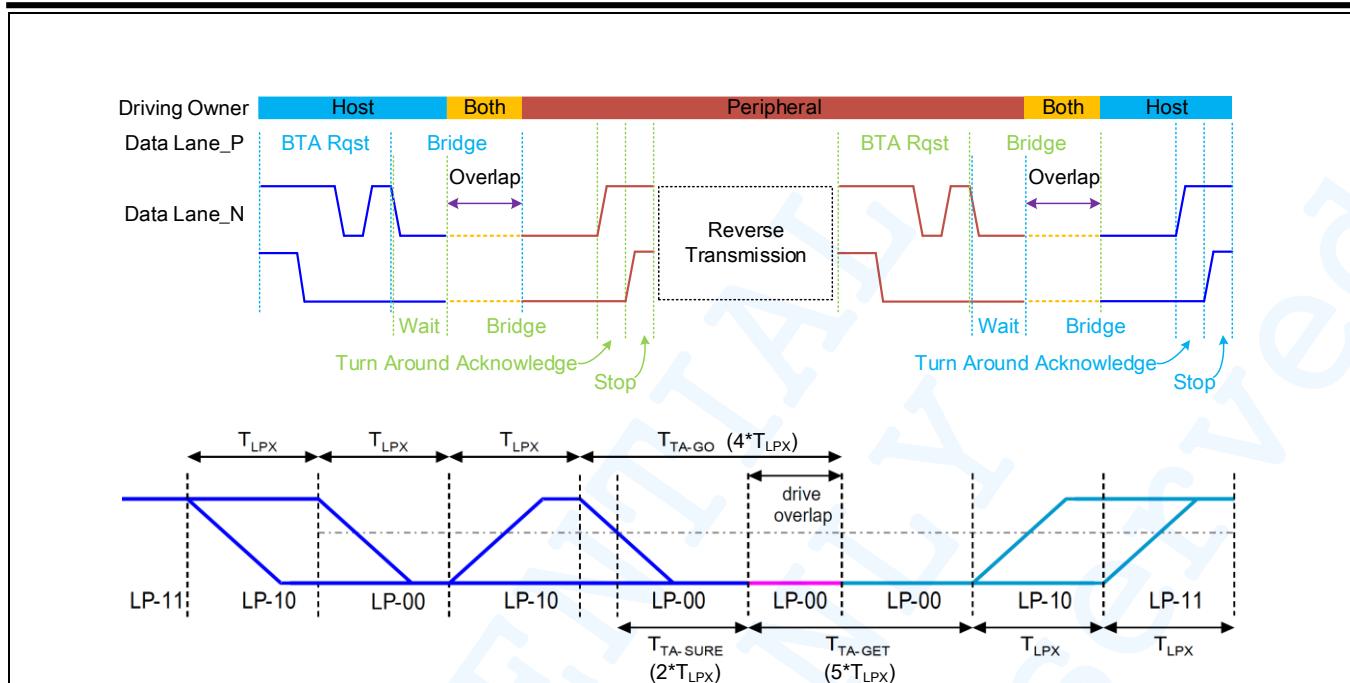

Figure 47 Bus Turn Around procedure

Figure 48 shows an example of BTA operations. The SLAVE get the lane controllability by BTA procedure to send the acknowledge packet on the successful data reception if there is no Error and send the acknowledge with error packet on the data reception if Error is occurred.

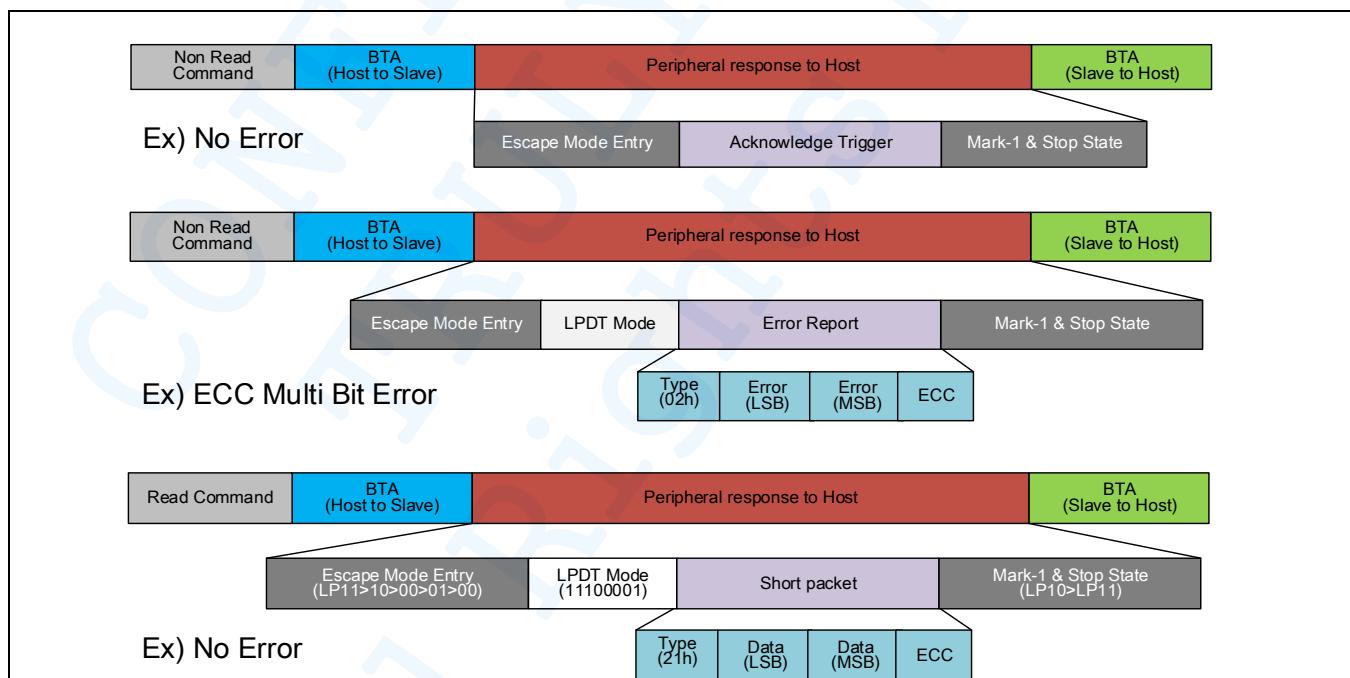

Figure 48 BTA Operation – No Error/Error after Non-Read Command

4.10.4.7 Escape Mode

Escape Mode is a special mode of operation for Data Lanes using Low-Power states. With this mode some additional functionality becomes available. Escape mode operation shall be supported in the Forward direction and is optional in the Reverse direction. If supported, Escape mode does not have to include all available features. A Data Lane shall enter Escape Mode via an Escape Mode Entry procedure (LP-11, LP-10, LP-00, LP-01, LP-00). As soon as the final Bridge state (LP-00) is observed on the Lines the Lane shall enter Escape Mode in Space state (LP-00). If an LP-10 is detected after the first Bridge state or an LP-11 is detected at any time before the final Bridge state (LP-00), the Escape Mode Entry procedure shall be aborted and the receive side shall wait for, or return to, the Stop state. Once Escape Mode is entered, the transmitter shall send an 8-bit entry command to indicate the requested action. Below table lists all currently available Escape Mode commands and actions. All unassigned commands are reserved for future expansion.

Table 31 MIPI Escape Mode Entry Code

| Escape Mode Action | Command Type | Entry Command Pattern (First Bit Transmitted to Last Bit Transmitted) | SH8601Z | |
|------------------------------------|--------------|--|---------|-------|
| | | | LP-Rx | LP-Tx |
| Low-power data transmission | mode | 11100001 (87h) | O | O |
| Ultra-low power state | mode | 00011110 (78h) | O | - |
| Undefined-1 | mode | 10011111 (F9h) | - | - |
| Undefined-2 | mode | 11011110 (7Bh) | - | - |
| Reset-trigger (Remote Application) | Trigger | 01100010 (46h) | O | - |
| TE trigger | Trigger | 01011101 (BAh) | - | O |
| Unknown-4 (Acknowledge trigger) | Trigger | 00100001 (84h) | - | O |
| Unknown-5 | Trigger | 10100000 (05h) | - | - |

The complete Escape mode action for a Trigger-Reset command is shown as follows. It shows the sequence of the low power data transmission.

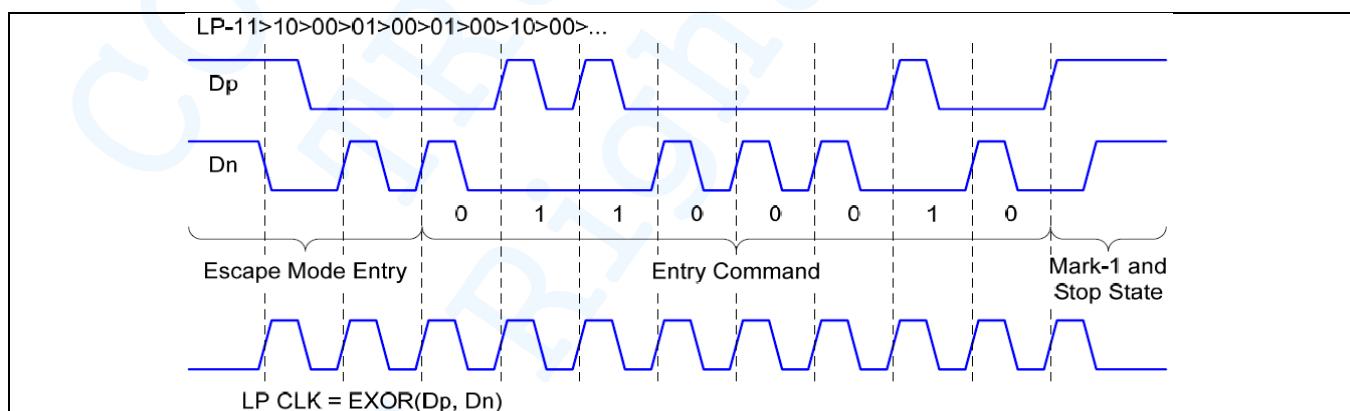

Figure 49 Trigger-Reset Command in Escape Mode

4.10.4.7.1 Escape mode Low-Power Data Lane Operation

If the Escape Mode Entry procedure is followed-up by the Entry Command for Low-Power Data Transmission (LPDT), Data can be communicated by the protocol at low speed, while the Lane remains in Low-Power mode. The PHY in Escape mode shall apply Spaced-One-Hot bit encoding for asynchronous communication. Therefore, operation of a Data Lane in this mode does not depend on the Clock Lane.

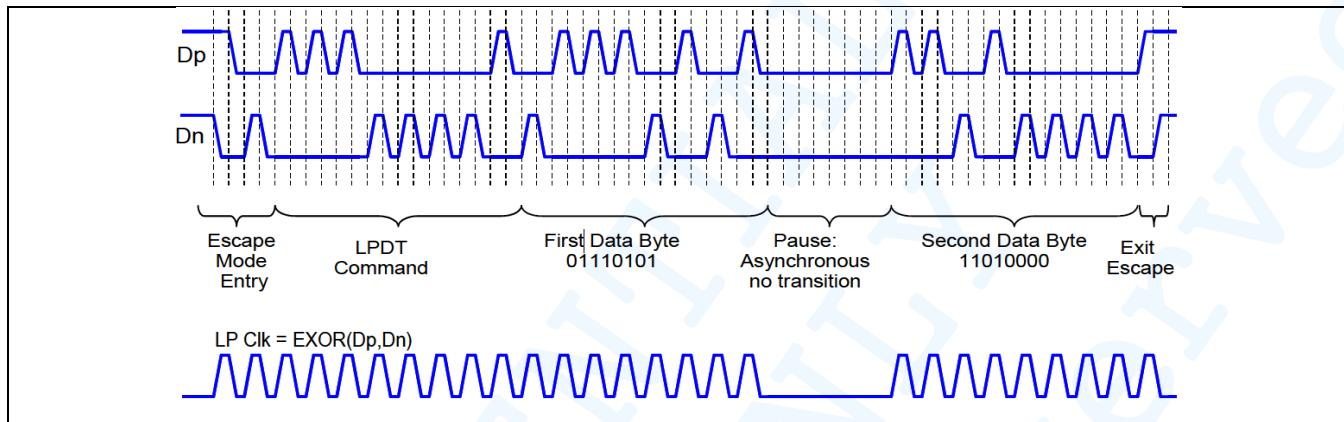

Figure 50 Data Byte Low-Power Data Transmission

4.10.4.7.2 Remote Application Reset

Remote Application Reset Command is used in case of transmission from the host processor to the peripheral. If the Entry Command Pattern matches the Remote Application Reset Command a Trigger is flagged to the protocol at the peripheral side via the logical PPI. The host processor can send software reset trigger by Remote Application Reset Packet.

Figure 51 Remote Application Reset

4.10.4.7.3 TE Signaling in DSI

A Command Mode display module has its own timings controller and local frame buffer for display refresh. In some cases, the host processor needs to be notified of timing events on the display module, e.g. the start of vertical blanking or similar timing information. In a traditional parallel-bus interface like DBI-2, a dedicated signal wire labeled TE (Tearing Effect) is provided to convey such timing information to the host processor. In a DSI system, the same information, with reasonably low latency, shall be transmitted from the display module to the host processor when requested, using the bi-directional Data Lane. The PHY for DSI has no inherent interrupt capability from peripheral to host processor so the host processor shall give bus ownership to the peripheral for extended periods, as it does not know when the peripheral will send the TE message. Since the timing of a TE event is, by definition, unknown to the host processor, the host processor shall give bus possession to the display module and then wait up to one video frame period for the TE response. During this time, the host processor cannot send new commands, or request to the display module, because it does not have bus possession. The TE Signaling function is enabled and disabled by three DCS commands to the display module's controller: set_tear_on, set_tear_off. After sending set_tear_on to enable this function, the host processor ends the transmission with BTA asserted, giving bus possession to the display module. Since the display module's DSI protocol layer does not interpret DCS commands, but only passes them through to the display controller, it responds with normal Acknowledge and returns bus possession to the host processor. In this state, the display module cannot report TE events to the host processor since it does not have bus possession. To enable TE

Reporting, the host processor shall give bus possession to the display module without an accompanying DSI command transmission after TE Signaling has been enabled. This is accomplished by the host processor's protocol logic asserting (internal) Bus Turn-Around signal to its PHY functional block. The PHY layer will then initiate a Bus Turn-Around sequence in LP mode which gives bus possession to the display module. This Trigger Message is reserved by DSI for TE signaling only and shall not be used for any other purpose in a DSI-compliant interface.

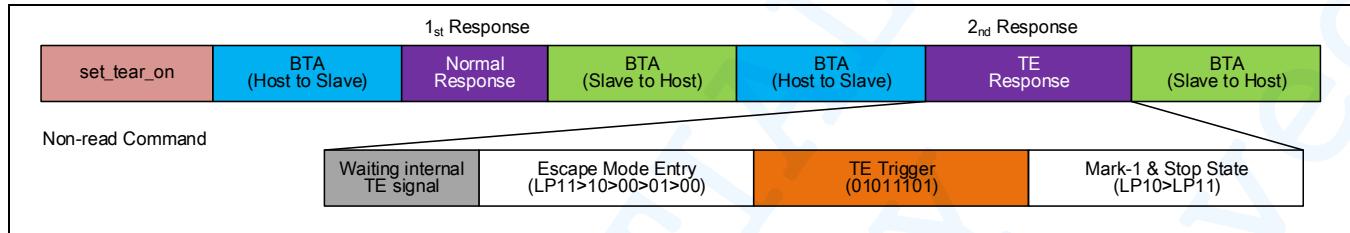

Figure 52 BTA Mode-TE Signaling

4.10.5 MIPI DSI Protocol

On the transmitter side of a DSI Link, parallel data, signal events, and commands are converted in the Protocol layer to packets. The Protocol layer appends packet-protocol information and headers, and then sends complete bytes through the Lane Management layer to the PHY. Packets are serialized by the PHY and sent across the serial Link. The receiver side of a DSI Link performs the converse of the transmitter side, decomposing the packet into parallel data, signal events and commands. If there are multiple Lanes, the Lane Management layer distributes bytes to separate PHYs, one PHY per Lane. Packet protocol and formats are independent of the number of Lanes used.

4.10.5.1 Multiple Packets per Transmission

The MIPI CORE of SH8601Z supports four data transmission defined in MIPI DSI specification. And in order to enhance the overall robustness of the system, DSI defines a dedicated EoT packet (EoTp) at the protocol layer for signaling the end of HS transmission. For backwards compatibility with earlier DSI systems, the capability of generating and interpreting this EoTp packet can be enabled or disabled with register.

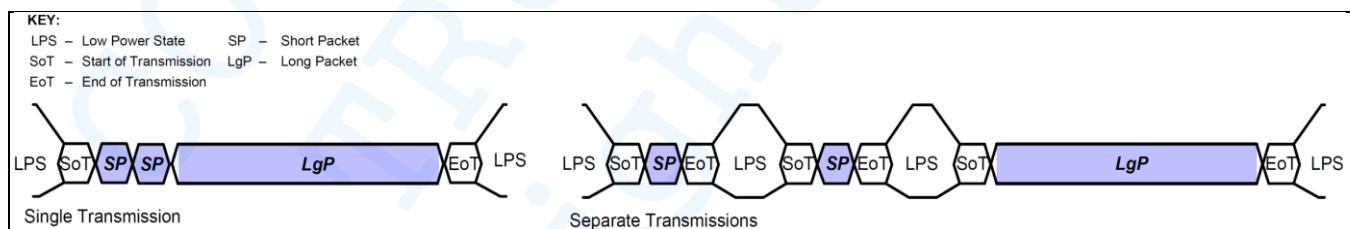

Figure 53 HS Transmission Examples with EoTp disabled

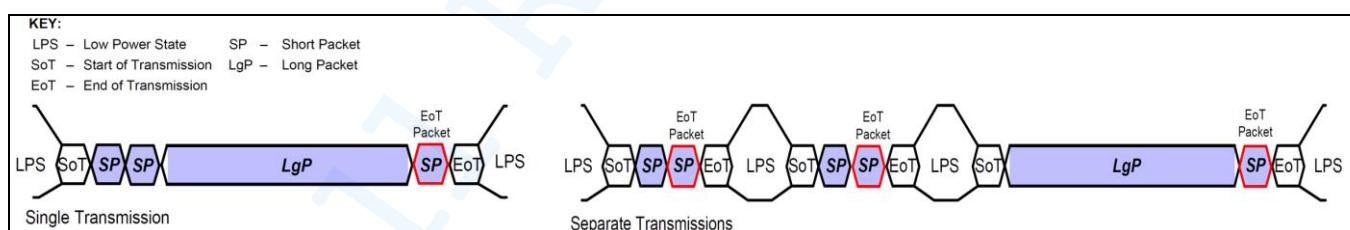

Figure 54 HS Transmission Examples with EoTp enabled

4.10.5.2 Endian Policy

All packet data traverses the interface as bytes. Sequentially, a transmitter shall send data LSB first, MSB last. For packets with multi-byte fields, the least significant byte shall be transmitted first unless otherwise specified. [Figure 55](#) shows a complete Long packet data transmission. Note, the figure shows the byte values in standard positional notation, i.e. MSB on the left and LSB on the right, while the bits are shown in chronological order with the LSB on the left, the MSB on the right and time increasing left to right.

| DI | WC (LS Byte) | WC (MS Byte) | ECC | Data | CRC (LS Byte) | CRC (MS Byte) |
|---|-------------------|-------------------|-------------------|-------------------|---------------|---------------|
| 0x29 | 0x01 | 0x00 | 0x06 | 0x01 | 0x0E | 0x1E |
| 1 0 0 1 0 1 0 0 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 1 0 0 0 0 0 1 0 0 0 0 0 0 0 0 0 1 1 1 1 0 0 0 0 0 0 1 1 1 1 0 0 0 | M L S S B B | M S B | |

Time →

Figure 55 Endian Example (Long Packet)

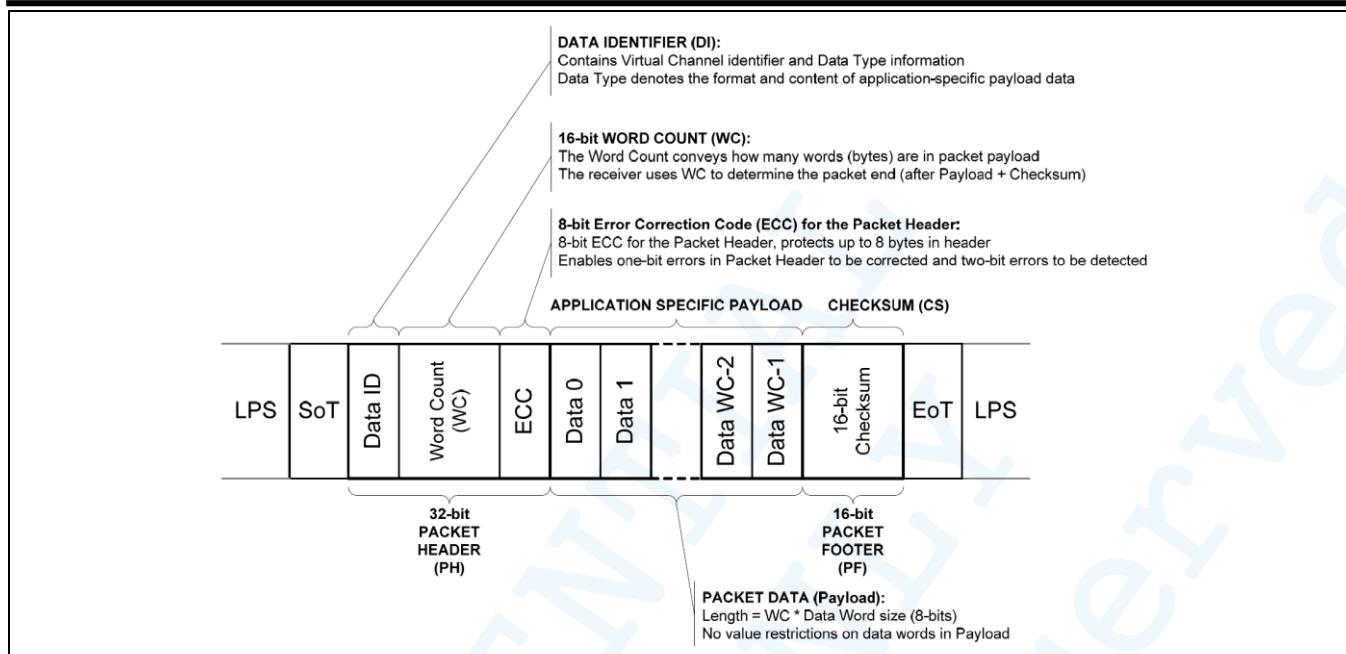

4.10.5.3 General Packet Structure

Two packet structures are defined for low-level protocol communication: Long packets and Short packets. For both packet structures, the Data Identifier is always the first byte of the packet.

4.10.5.3.1 Long Packet Format

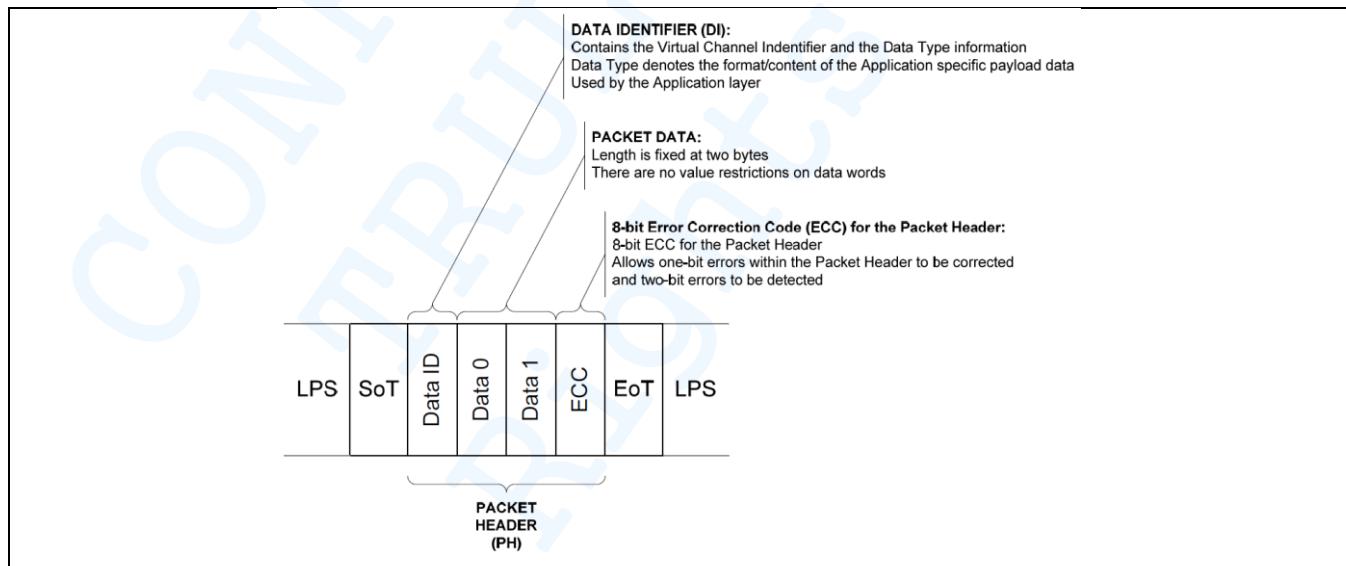

Figure 44 shows the structure of the Long packet. A Long packet shall consist of three elements: a 32-bit Packet Header (PH), an application-specific Data Payload with a variable number of bytes, and a 16-bit Packet Footer (PF). The Packet Header is further composed of three elements: an 8-bit Data Identifier, a 16-bit Word Count, and 8-bit ECC. The Packet Footer has one element, a 16-bit checksum. Long packets can be from 6 to 65,541 bytes in length. In the Long Packet, Packet Footer is added after Packet Data. Packet footer includes CRC calculated from Packet Data as checksum.

The Checksum (2 bytes) shall be realized as a 16bit CRC (Packet Data): Polynomial = $X^{16} + X^{12} + X^5 + X^0$

Figure 56 Long Packet Structure

4.10.5.3.2 Short Packet Structure

Figure 75 shows the structure of the Short packet. A Short packet shall contain an 8-bit Data ID followed by two command or data bytes and an 8-bit ECC. A Packet Footer shall not be present. Short packets shall be four bytes in length. The Error Correction Code (ECC) byte allows single-bit errors to be corrected and 2-bit errors to be detected in the Short packet.

Figure 57 Short Packet Structure

4.10.5.4 Common Packet Element

Long and Short packets have several common elements.

4.10.5.4.1 Data Identifier Byte

The first byte of any packet is the DI (Data Identifier) byte. Figure 45 shows the composition of the Data Identifier (DI) byte.

DI[7:6] - These two bits identify the data as directed to one of four virtual channels.

DI[5:0] - These six bits specify the Data Type.

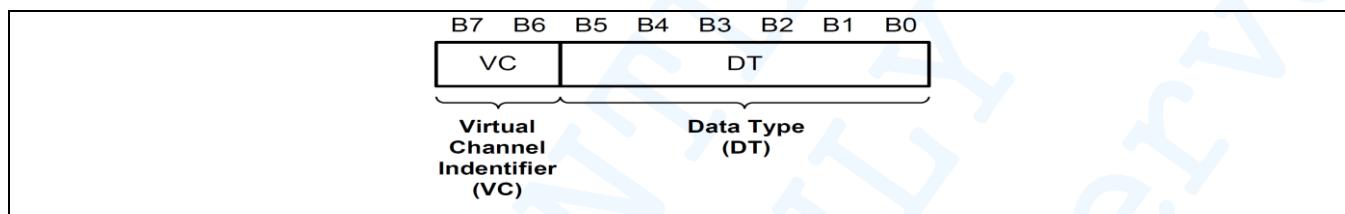

Figure 58 Data Identifier Byte

4.10.5.4.1.1 Virtual Channel Identifier – VC field DI[7:6]

A processor may service up to four peripherals with tagged commands or blocks of data, using the Virtual Channel ID field of the header for packets targeted at different peripherals.

4.10.5.4.1.2 Data Type Field – DT[5:0]

The Data Type field specifies if the packet is a Long or Short packet type and the packet format. The Data Type field, along with the Word Count field for Long packets, informs the receiver of how many bytes to expect in the remainder of the packet. This is necessary because there are no special packet start/end sync codes to indicate the beginning and end of a packet. This permits packets to convey arbitrary data, but it also requires the packet header to explicitly specify the size of the packet. When the receiving logic has counted down to the end of a packet, it shall assume the next data is either the header of a new packet or the EoT (End of Transmission) sequence.

4.10.5.4.2 Error Correction Code

The Error Correction Code allows single-bit errors to be corrected and 2-bit errors to be detected in the Packet Header. The host processor shall always calculate and transmit an ECC byte. Peripherals shall support ECC in both forward- and reverse-direction communications. ECC is generated from the twenty-four data bits within the Packet Header as illustrated in Figure 46.

4.10.5.7 Color Format

There are several data packet structure for pixel data transmission, 16-bit (5-6-5) format, two 18-bit (6-6-6) formats, 24-bit format (8-8-8) and the data packet structures.

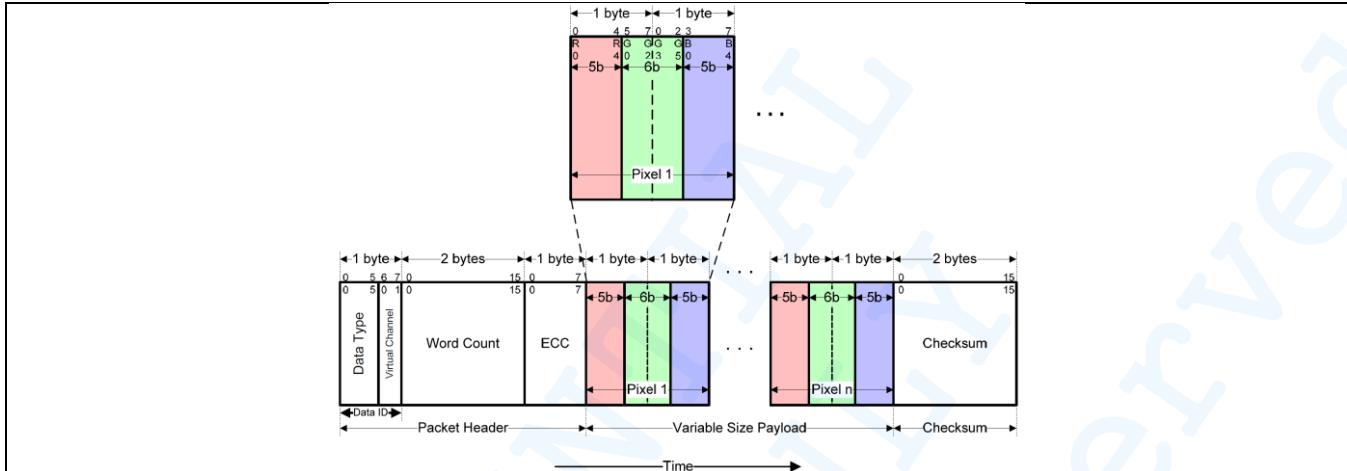

Figure 60 16-bit per Pixel - RGB Color Format, Long Packet

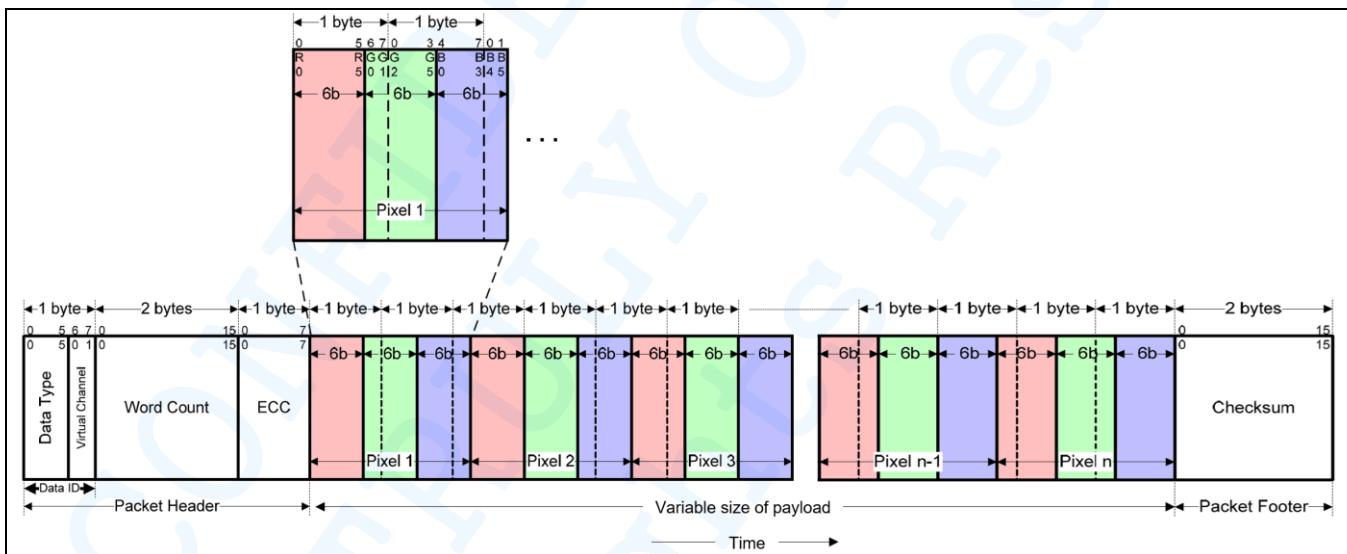

Figure 61 18-bit per Pixel (Packed) - RGB Color Format, Long Packet

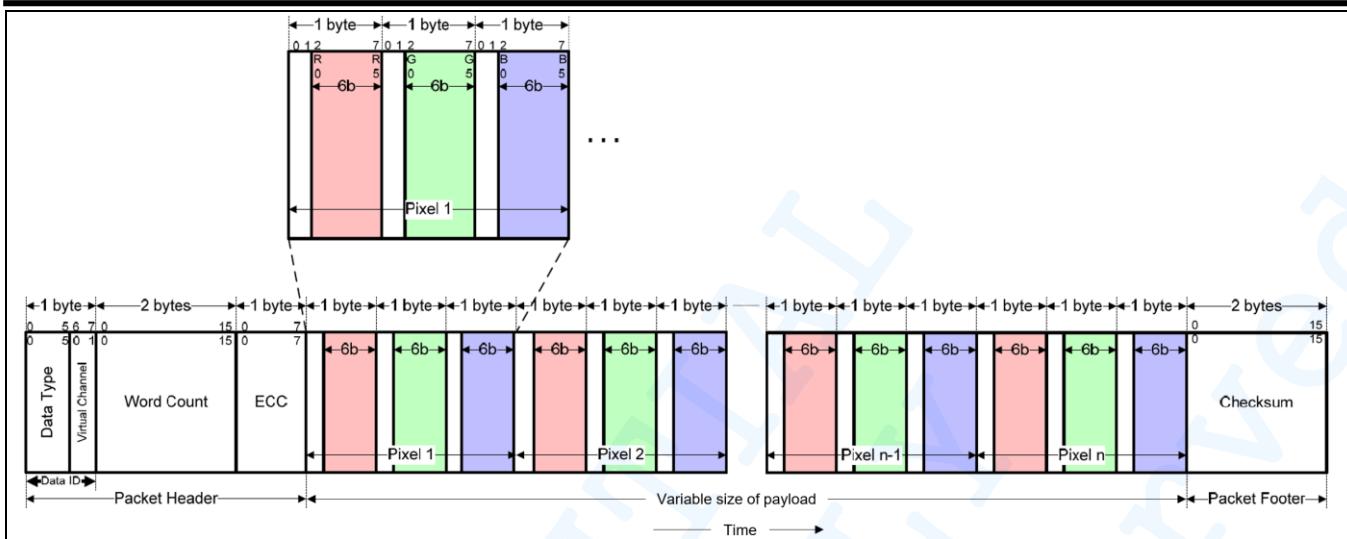

Figure 62 18-bit per Pixel(Loosely Packed) - RGB Color Format, Long Packet

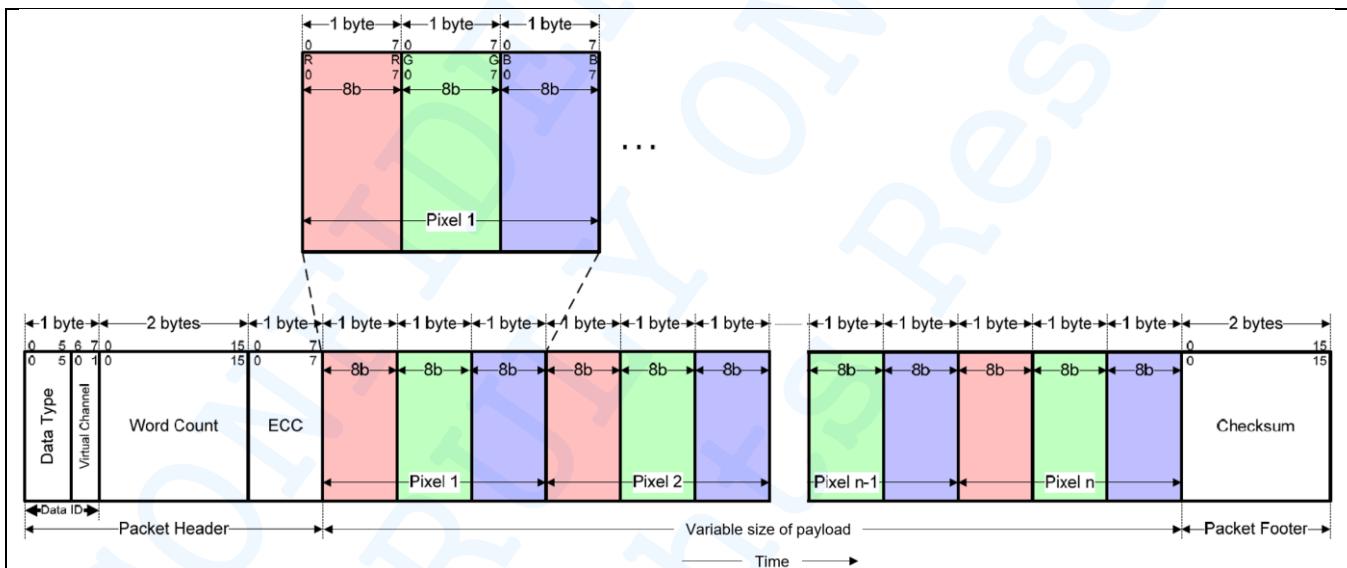

Figure 63 24-bit per Pixel RGB Color Format, Long Packet

4.10.5.8 Error Report Packet

An error report is a Short packet comprised of two bytes following the DI byte, with an ECC byte following the Error Report bytes. By convention, detection and reporting of each error type is signified by setting the corresponding bit to “1”.

Table 34 Error Report Bit Definitions

| Bit | Description |
|-----|--|
| 0 | SoT error |
| 1 | SoT sync error |
| 2 | EoT sync error |
| 3 | Escape Mode Entry command error |
| 4 | Low-power transmit sync error |
| 5 | HS receive timeout error (Timeout error) |
| 6 | False control error |
| 7 | Contention detection error |
| 8 | ECC error, single-bit (Detected and corrected) |
| 9 | ECC error, multi-bit (Detected, not corrected) |
| 10 | Checksum error (Long packet only) |
| 11 | DSI data type not recognized |
| 12 | DSI VC ID invalid |
| 13 | Invalid transmission length |
| 14 | Reserved |
| 15 | DSI protocol violation |

4.10.5.9 Transmission Packet Sequences

DSI supports several formats, or packet sequences, for Video Mode data transmission. The peripheral’s timing requirements dictate which format is appropriate. In the following sections, Burst Mode refers to time-compression of the RGB pixel (active video) portion of the transmission. In addition, these terms are used throughout the following sections:

- Non-Burst Mode with Sync Pulses – enables the peripheral to accurately reconstruct original video timing, including sync pulse widths.
- Non-Burst Mode with Sync Events – similar to above, but accurate reconstruction of sync pulse widths is not required, so a single Sync Event is substituted.
- Burst mode – RGB pixel packets are time-compressed, leaving more time during a scan line for LP mode (saving power) or for multiplexing other transmissions onto the DSI link.

4.10.5.9.1 Non-Burst Mode with Sync Pulses

With this format, the goal is to accurately convey DPI-type timing over the DSI serial Link. This includes matching DPI pixel-transmission rates, and widths of timing events like sync pulses. Accordingly, synchronization periods

are defined using packets transmitting both start and end of sync pulses.

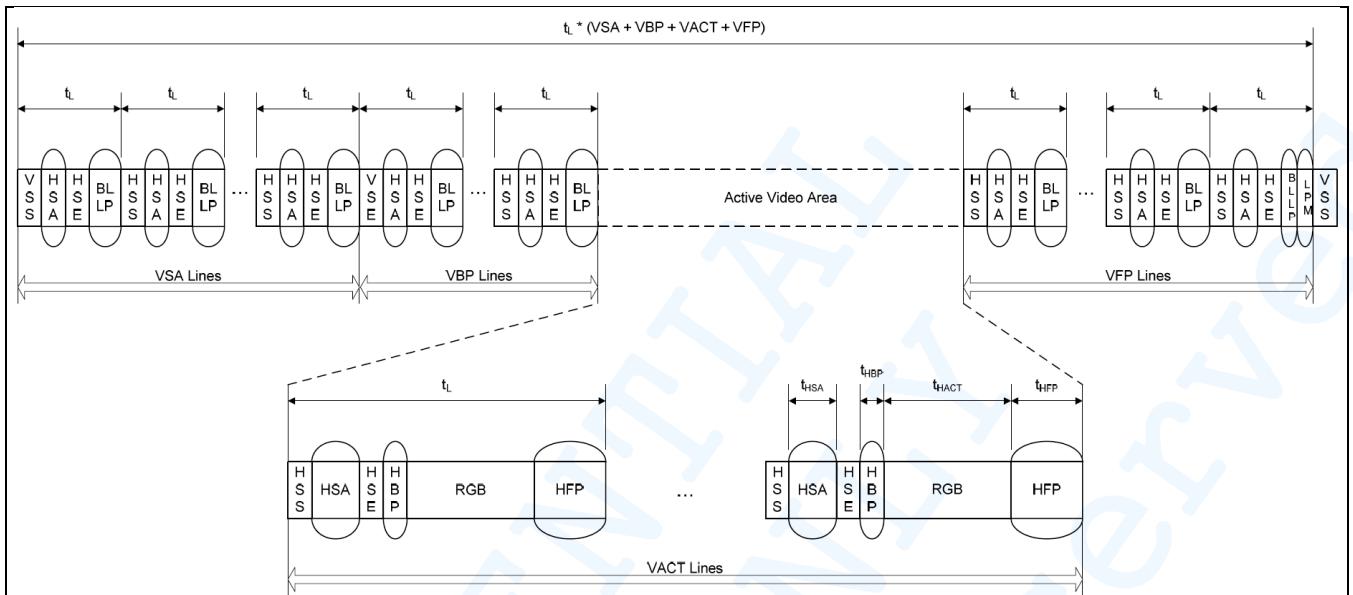

Figure 64 Non-Burst Transmission with Sync Start and End

4.10.5.9.2 Non-Burst Mode with Sync Events

This mode is a simplification of the format described in section 8.11.2. Only the start of each synchronization pulse is transmitted. The peripheral may regenerate sync pulses as needed from each Sync Event packet received. Pixels are transmitted at the same rate as they would in a corresponding parallel display interface such as DPI-2.

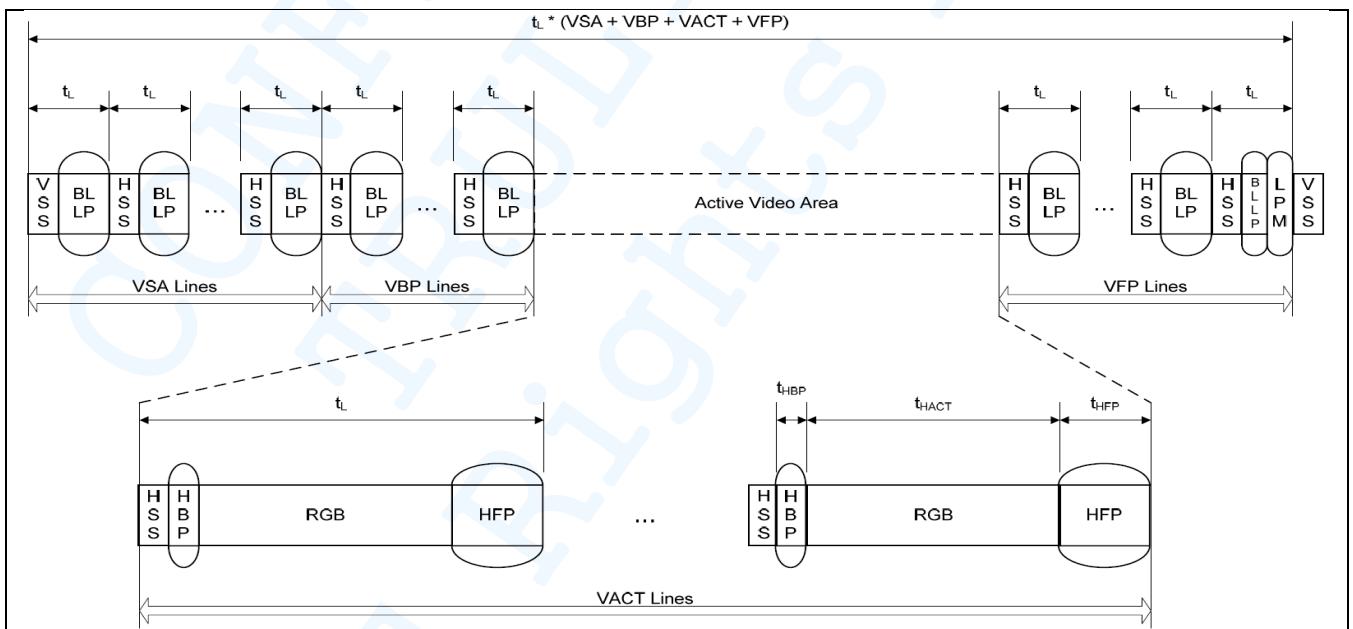

Figure 65 Non-Burst Transmission with Sync Events

4.10.5.9.3 Burst Mode

In this mode, blocks of pixel data can be transferred in a shorter time using a time-compressed burst format. This is a good strategy to reduce overall DSI power consumption, as well as enabling larger blocks of time for other data transmissions over the Link in either direction.

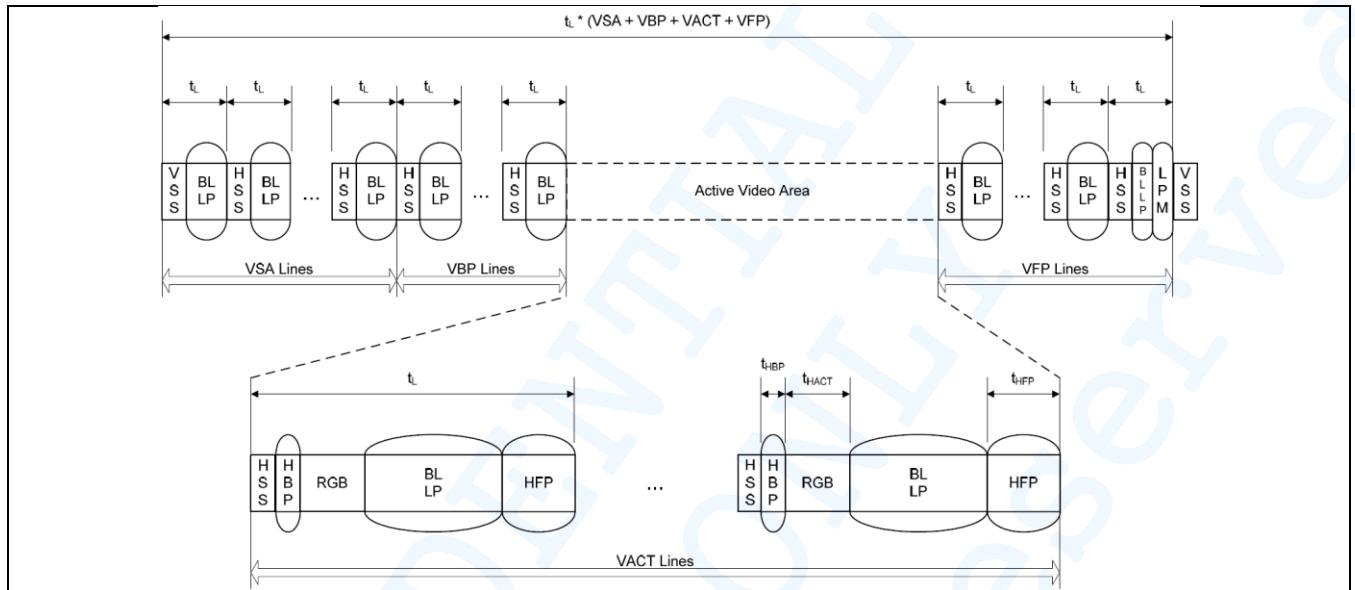

Figure 66 Burst Transmission

4.10.6 MIPI Interface Timing on Video Mode

SH8601Z video mode operates as RGB interface.

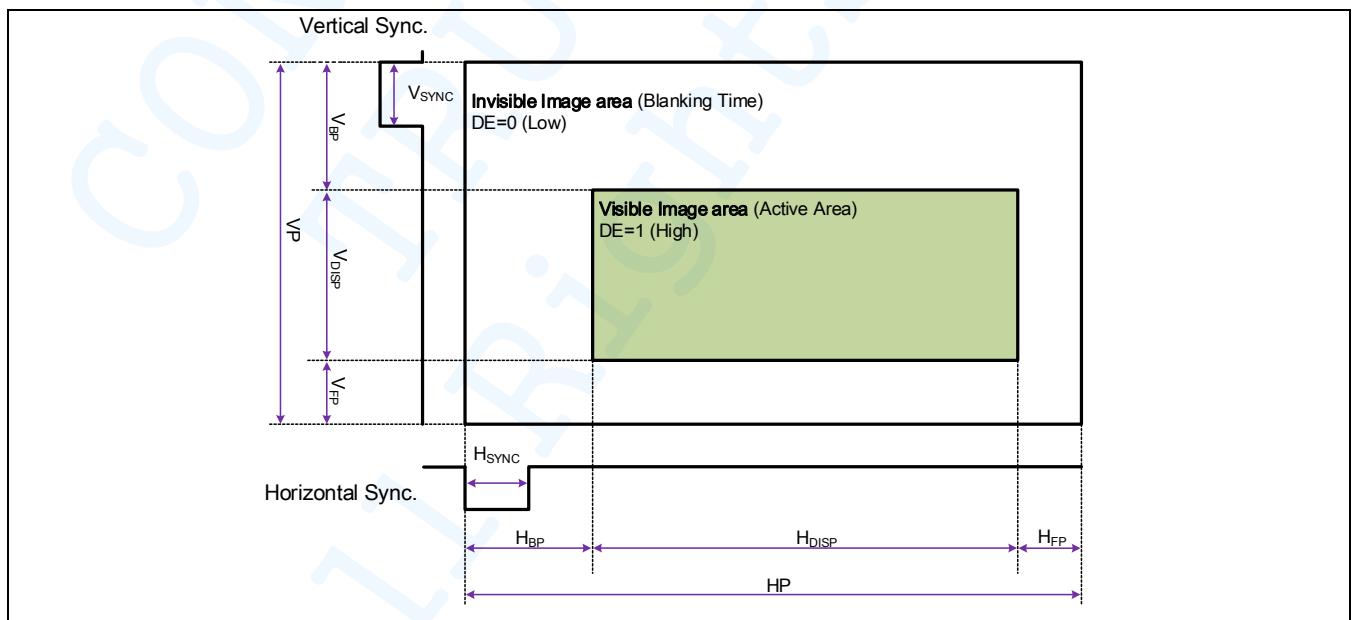

Figure 67 Display Timing (Video Mode)

4.10.6.1 Vertical Display Timing

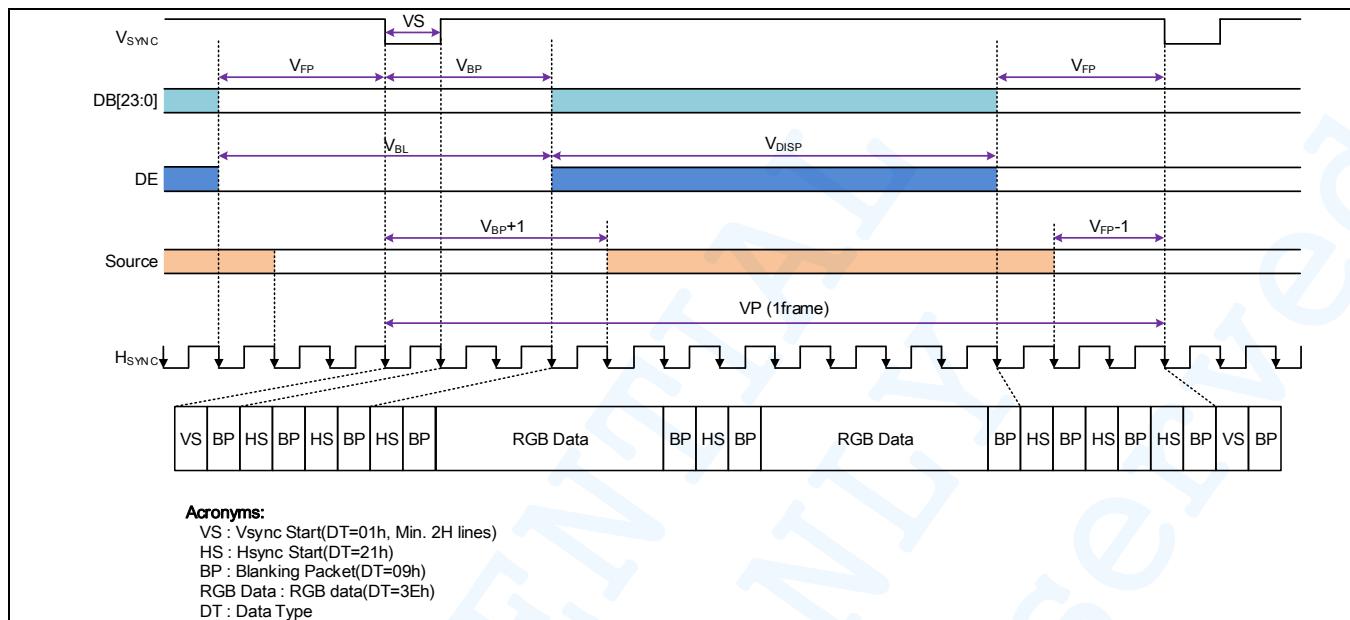

Figure 68 Vertical Display Timing

Table 35 Vertical Timing for Video Mode

| Item | Symbol | Condition | Min. | Typ. | Max. | Unit | Note |
|--------------------------|--------|-----------|------|------|------|------|----------------|
| Vertical cycle | VP | — | 200 | 496 | - | line | (1) |
| Vertical low pulse width | VS | — | 1 | 2 | 2 | | (1) (2) (3) |
| Vertical front porch | VFP | — | 6 | 8 | - | | (1) (3) |
| Vertical back porch | VBP | — | 6 | 8 | 255 | | (1) (2) (3) |
| Vertical blanking period | VBL | VBP + VFP | 12 | 16 | - | | |
| Vertical active area | — | VDISP | 192 | 480 | 960 | | (1) (3) |
| (Vertical refresh area) | (VRR) | — | — | 60 | — | Hz | |

NOTE:

1. Typical values are for resolution of 480 x 480 application.
2. VBP are set as back porch by B1h NOR_VBP/VFP[11:0].
3. VS, VBP and VFP values are typical value.
4. 960 of vertical active area is available only at 192 x 960 resolution.

4.10.6.2 Horizontal Display Timings

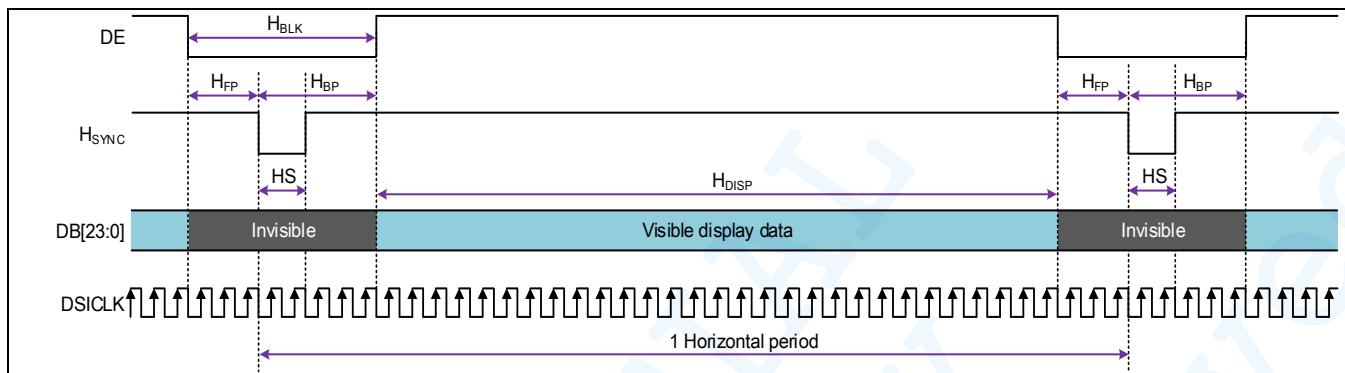

Figure 69 Horizontal Display Timing

Table 36 Horizontal Timings for Video Mode

| Item | Symbol | Condition | Min. | Typ. | Max. | Unit | Note |
|-----------------------------|--------|-----------|------|------|------|------|----------------|
| HS cycle | HP | — | 216 | 516 | - | PCLK | (2) |
| HS low pulse width | HS | — | 1 | 2 | 2 | | (1) (2) (3) |
| Horizontal back porch | HBP | — | 8 | 16 | - | | (3) |
| Horizontal front porch | HFP | — | 8 | 20 | - | | (3) |
| Horizontal data start point | — | HBP | 8 | 16 | - | | (3) |
| Horizontal blanking period | HBLK | HBP + HFP | 16 | 36 | - | | |
| Horizontal active area | HDISP | — | 192 | 480 | 480 | | (1) |

NOTE:

1. Typical values are for resolution of 480 x 480 application.
2. PCLK is pixel clock and same as byte-clock that is generated by dividing CLK by 4 (ex. 500 Mbps, 16ns).
3. HS, HBP and HFP values are typical value.

5 Command

5.1 List of User Command

Operational Code is abbreviated by Opcode, Read/Write/Command is abbreviated by RWC, and Number of Parameter bytes is abbreviated by Num. of Para.

Table 37 List of Level 1 Command

| OpCode (Hex) | Function | R/W/C | Num. of Para. | Parameters |
|-----------------|---|-------|------------------|--|
| 00 | No Operation | C | - | NO operation |
| 01 | Software Reset | C | - | - |
| 04 | Read Display Identification Information | R | 3 | ID1/2/3 |
| 05 | Read Number of Errors on DSI | R | 1 | Number of the error on DSI |
| 0A | Read Display Power Mode | R | 1 | Display power mode |
| 0B | Read Display MADCTL | R | 1 | MX, BGR |

| DC | Read ID3 | R | 1 | Read ID3 |

NOTE:

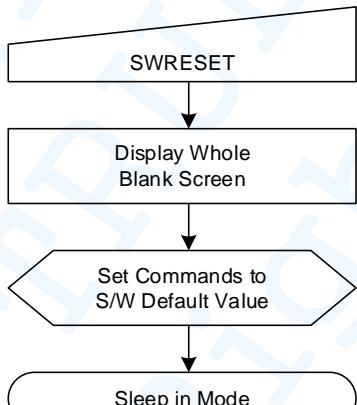

1. Undefined commands are treated as NOP (00H) command.
2. Commands 10H, 28H, 29H, 36H, 51H, 53H, 55H, 61H, 63H, and 66H are updated during V-sync when Module is in Sleep Out Mode to avoid abnormal visual effects. During Sleep In mode, these commands are updated immediately. Read Display Power Mode (0Ah), Read Display MADCTL (0Bh), Read Display Pixel Format (0Ch), Read Display Image Mode (0Dh), Read Display Signal Mode (0Eh), Read Display Self-Diagnostic Result (0Fh), Read Display Brightness Value in normal mode(52h), Read CTRL Display1 (54h), Read CTRL Display2 (56h), Read Display Brightness Value in AOD Mode (4BH), Read Display Brightness Value in HBM Mode (64H) are updated immediately both in Sleep In mode and Sleep Out mode.
3. Parameters of the command are stored onto registers when the last parameter of the command has been received. Also, parameters of the command are not stored onto registers if there has been happen a break. This note is valid when a number of the parameters are equal or less than 32.

5.2 Description of User Command

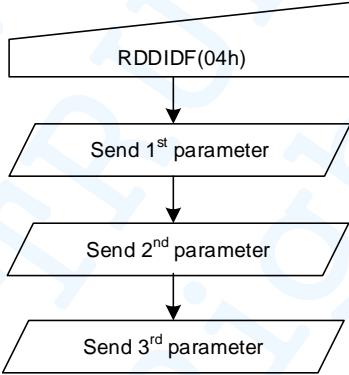

5.2.1 NOP (00h): No Operation

| NOP (No Operation) | | | | | | | | | | |
|-----------------------|--|----|----|----|----|---------------|----|----|----|-----|
| 00H | Write/Read | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | HEX |
| - | Write | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00 |
| Command | No Parameter | | | | | | | | | |
| Parameter | This command is an empty command. It does not have any effect on the display module. | | | | | | | | | |
| Description | - | | | | | | | | | |
| Restriction | | | | | | | | | | |
| Register Availability | Status | | | | | Availability | | | | |
| | Sleep Out | | | | | Yes | | | | |
| | Sleep In | | | | | Yes | | | | |
| Default | Status | | | | | Default Value | | | | |
| | Power On Sequence | | | | | N/A | | | | |
| | S/W Reset | | | | | N/A | | | | |
| | H/W Reset | | | | | N/A | | | | |

5.2.11 SLPIN (10h): Sleep In

| 10H | | SLPIN (Sleep In) | | | | | | | | | |
|-----------------------|---|------------------|----|----|--|----|----|----|----|-----|--|
| - | Write/Read | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | HEX | |
| Command | Write | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 10 | |
| Parameter | No Parameter | | | | | | | | | | |
| Description | <p>This command causes the display module to enter the minimum power consumption mode. In this mode, the DC/DC converter is stopped, Internal oscillator is stopped, and panel scanning is stopped.</p> | | | | | | | | | | |
| Restriction | <p>This command has no effect when module is already in Sleep In mode. Sleep In mode can only be left by the Sleep Out command (11h).</p> <p>It will be necessary to wait 5ms before sending next command. This is to allow time for the supply voltages and clock circuits to stabilize.</p> <p>It will be necessary to wait 80ms after sending Sleep Out command (when in Sleep In mode) before Sleep In command can be sent.</p> | | | | | | | | | | |
| Register Availability | Status | | | | Availability | | | | | | |
| | Sleep Out | | | | Yes (Reflect in the next V-sync period). | | | | | | |
| Default | Status | | | | Default Value | | | | | | |
| | Power On Sequence | | | | Sleep In Mode | | | | | | |
| | S/W Reset | | | | Sleep In Mode | | | | | | |
| | H/W Reset | | | | Sleep In Mode | | | | | | |
| Flow Chart | <p>It takes about 80ms before it goes into Sleep-in Mode (Booster off state) after SLPIN command.</p>  <pre> graph TD SLPIN[SLPIN] --> Blank[Display whole blank screen Automatic No effect to DISPON/DISPOFF commands] Blank --> Drain[Drain Charge From Display Panel] Drain --> DCDC[Stop : DCDC Converter] DCDC --> IO[Stop : Internal Oscillator] IO --> SInMode[Sleep In Mode] </pre> <p>Legend:</p> <ul style="list-style-type: none"> Command Parameter Display Action Mode Sequential Transfer | | | | | | | | | | |

NOTE: Refer to customer appendix for SLPIN sequence

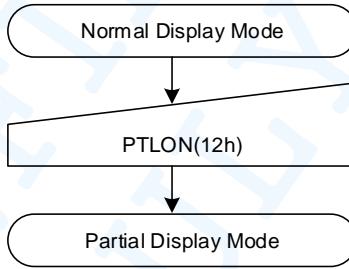

5.2.12 SLPOUT (11h): Sleep Out

| 11H | | SLPOUT (Sleep Out) | | | | | | | | | |
|-----------------------|--|--------------------|---------------|----|----|----|--|----|----|-----|--|
| - | Write/Read | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | HEX | |
| Command | Write | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 11 | |
| Parameter | No Parameter | | | | | | | | | | |
| Description | <p>This command turns off sleep mode. In this mode the DC/DC converter is enabled, Internal oscillator is started, and panel scanning is started.</p> | | | | | | | | | | |
| Restriction | <p>This command shall not cause any visible effect on the display module when the module is already in Sleep Out mode. Sleep Out Mode can only be left by the Sleep In command (10h) This host processor must wait 5msec after sending this command before sending other command. The display module loads all display supplier's factory default values from internal OTP to the registers during this 5msec. Also the host processor must wait 85msec after sending a Sleep Out command before sending a Sleep In command to avoid abnormal Sleep In status. This delay time allows the internal power circuits and clock circuits to stabilize.</p> | | | | | | | | | | |
| Register Availability | Status | | Availability | | | | | | | | |
| | Sleep Out | | Yes | | | | | | | | |

| 1st Para | Write | 0 | 0 | 0 | 0 | 0 | 0 | 0 | TEM | 00 | | | | | | | | | | | |
| This command is used to turn on the Tearing Effect output signal from the TE signal line. The TEON has one parameter that describes the mode of the Tearing Effect Output Line. | | | | | | | | | | | | | | | | | | | | | |
| When TEM = 0 & TE_SCANLINE (in TESCAN, 44h) = 0 : TE Output line consists of V-Blanking information only | | | | | | | | | | | | | | | | | | | | | |
| Description |  | | | | | | | | | | | | | | | | | | | | |
| | When TEM = 0 & TE_SCANLINE (in TESCAN, 44h) = N (N≠0) : TE Output line consists of one H-Blanking information only | | | | | | | | | | | | | | | | | | | | |
| |  | | | | | | | | | | | | | | | | | | | | |
| When TEM = 1 : TE Output line consists of one V-Blanking and H-Blanking information | | | | | | | | | | | | | | | | | | | | | |
|  | | | | | | | | | | | | | | | | | | | | | |
| NOTE: NOTE: During Sleep In Mode with Tearing Effect Line On, Tearing Effect Output pin will be active Low. | | | | | | | | | | | | | | | | | | | | | |
| Restriction | This command has no effect when Tearing Effect output is already On. For enabling Tearing Effect Bus Trigger information, parameter TEM should be "0". | | | | | | | | | | | | | | | | | | | | |
| Register Availability | Status | | | | | Availability | | | | | | | | | | | | | | | |

NOTICE

SHM may make changes to specifications and product descriptions without notice at any time. User must not rely on the absence or characteristics of any features or instructions marked "reserved", "TBD" or "undefined".

It reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata sheets which may cause the product to deviate from published specifications. Contact your SHM sales office or headquarter to obtain the latest specifications.

Customer should use the SHM products described in this document within the range specified by SHM, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. SHM shall have no liability for malfunctions or damages arising out of the use of SHM products beyond such specified ranges.

This document may not be reproduced, duplicated, or disclosed to any third parties in any form, in whole or in part, without prior written consent of SHM.
