## Overview

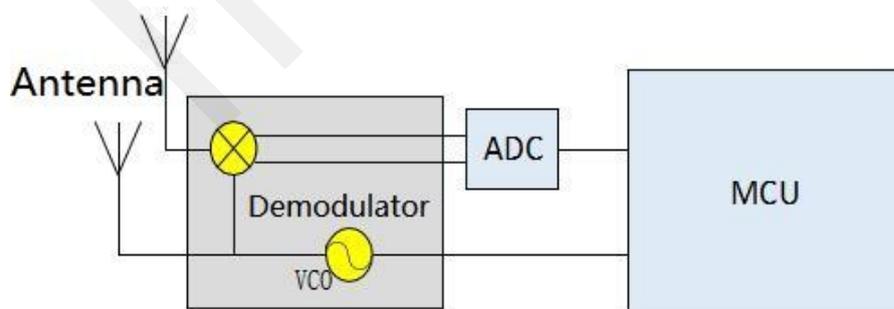

This document mainly describes the use of the radar and the problems needing attention in each stage, so as to reduce the design cost and increase the stability of the product as much as possible and improve the completion efficiency of the project.

From the hardware circuit reference design, the layout requirements of radar antenna and shell, how to distinguish interference and multifunctional standard UART protocol output.

The radar is a self-contained space sensing sensor, which is a module composed of RF antenna, radar chip and high-speed main frequency MCU. Relying on the stable, flexible and superior algorithm architecture core, the radar can solve the user's various scene detection needs. It can be equipped with upper computer or host computer to flexibly output detection status and data, meet several groups of GPIO, and can be customized and developed by users.

### 1. Operating Principle

The radar transmits 24G band millimeter wave signal, the measured target reflects electromagnetic wave signal, demodulates the transmitted signal, and then obtains echo demodulated signal data through amplification, filtering, ADC and other processing. The amplitude, frequency and phase of echo signal are solved in MCU unit, and finally the measurement of target parameters (breathing, motion, micro motion, etc.) and scene evaluation are realized.

## 2. Precautions for Hardware Design

The rated power supply voltage of the radar shall meet 4.9 - 6V.  
 Under normal working conditions, the rated current requires an input of more than 200mA. Power supply design, power ripple shall be  $\leq 100\text{mV}$ .

### 2.1 Circuit for Reference of Power Supply Design

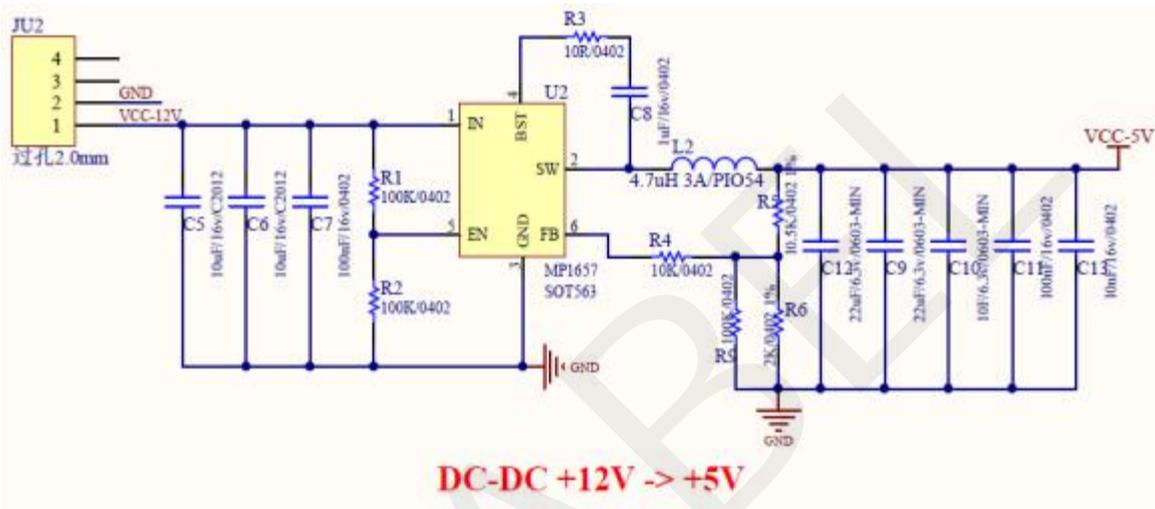

Figure 1

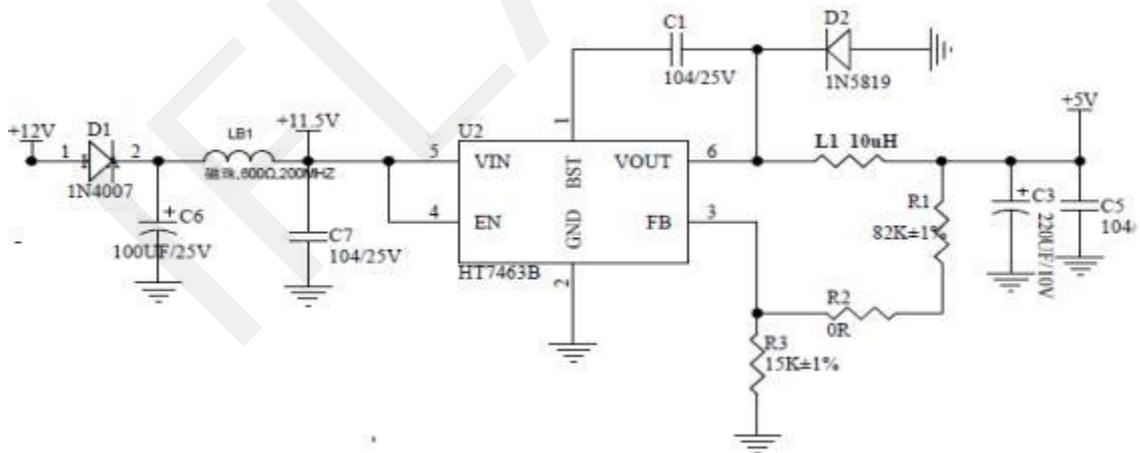

Figure 2

## 2.2. Wiring Diagram

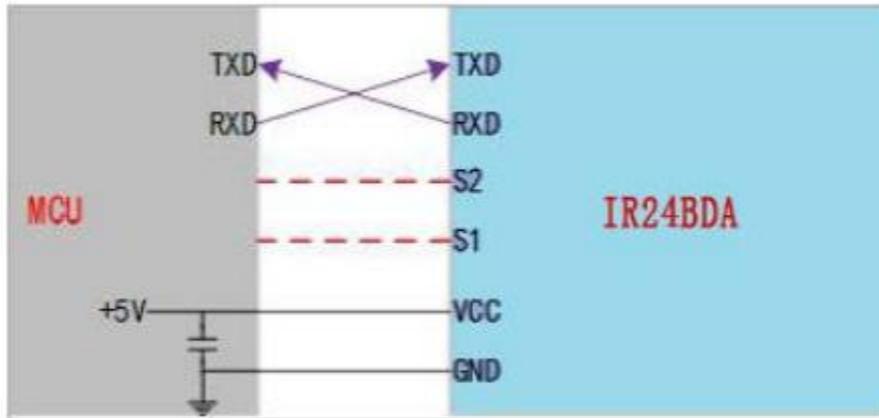

Figure 3. Wiring Diagram of Radar Module and Peripheral Device

## 3. Layout Requirements of Antenna and Case

PCBA: Height of Radar Mount Above Other Components  $\geq 1\text{mm}$

Case Structure: Radar Antenna Plane to Case: 2 - 5mm

External Detection Surface: Non-metallic plane, no curve to avoid affection on performance of detection coverage

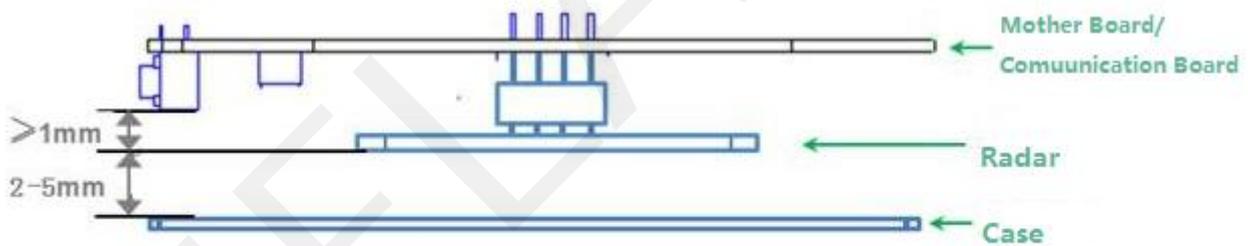

Figure 4

---

## 4. Electrostatic Protection

The radar product has an electrostatic sensitive circuit inside, which is vulnerable to electrostatic hazards. Therefore, it is necessary to do a good job in electrostatic protection in the process of transportation, storage, work and taking. Do not touch and grasp the antenna surface and connector pins of the radar module, but only the corners.

When operating the radar sensor, please wear anti-static gloves.

## 5. Factors Interfering Radar Function

### 5.1 Abnormal Output of Nobody State

**Under normal circumstances, radar will accurately judge states of human body sitting down/sleeping and output falling, respiration and other vital signs.**

- A.** Movements from doorway, the other side of wooden wall detected due to too large radar scanning coverage  
Adjustment: Tune down sensitivity and set up scenario for radar
- B.** Radar faces down air-conditioning, fan in operating  
Adjustment: Readjust the position of radar
- C.** Swinging objects by airflow from air-conditioning  
Adjustment: Cotton, non-metallic objects will not cause false-alarm and metallic objects need to be fixed
- D.** False alarm by Vibration of Radar not fixed  
Adjustment: Avoid shaking or vibration
- E.** Pets, flying birds or other moving objects  
Adjustment: Because of the high sensitivity of slight motion detection, this cannot be excluded
- F.** False judgement from interference of power supply  
Adjustment: Stabilize the current and reduce ripple

## 5.2 Abnormal Output of Somebody State

**Radar judges human presence via sending and receiving electromagnetic wave, closer to radar, higher the accuracy**

- A.** Human body beyond radar scanning coverage  
Adjustment: Readjust the installation angle. Detection range varies slightly in different environments due to different reflection coverage
- B.** False output due to shading by metallic objects  
Too thick office desks, chairs made from metal will block electromagnetic wave and cause a false alarm
- C.** Difference in scanning angle  
Adjustment: Human body not scanned by radar, causing a false alarm
- D.** Low sensitivity of radar  
Adjustment: Use parameter condition of radar to improve

IFLABEL

## 6. Functions

### 6.1. Description of Functions

| Function Points   | Time of State Change/Explanation   |
|---|--|
| DP1: somebody/nobody  | nobody to somebody, report within 0.5s<br>somebody to nobody, output "No" in 1to 2mins |
| DP2: stationary/moving  | shift between stationary and moving states, report within 0.5s                         |
| DP3: personnel approaching/leaving/no directional movement                  | output every 2s  |
| DP4: parameter of body motion amplitude from 0 - 100                        | output every 5s refer to (section 6.2)   |
| DP5: sensitivity gear from 0 - 9  | 10 gears for default scenario  |
| DP7: scenario (bed,bathroom,hotel,bedroom,office,default)                   | different scenarios according to size of coverage                                      |
| DP8: confirm reminder of false alarm of nobody                              |  |
| DP9: switch for falling detection   | default:shut down, only effective when turned on                                       |
| DP10: in bed/out of bed   | output state in 3s   |
| DP11: Times of in bed/out of bed  | summarize times of in bed/out of bed in a day  |
| DP12: sleep assessment  | three states, output every 10 min  |
| DP13: awake time duration   |  |
| DP14: light sleep time duration   |  |
| DP15: deep sleep time duration  |  |
| DP16: respiratory rate  | test normal respiratory rate   |
| DP17: respiratory rate detecting signal                                     | output states like distance, range and etc   |
| DP18: sleep quality score (optional, users may stipulate depending on will) | score every day's sleep quality  |

## 6.2. Output Description of Body Motion Amplitude Parameters

| Parameter of Body Motion Amplitude |                                    |                                   |
|------------------------------------|------------------------------------|-----------------------------------|
| 0%                                 | nobody                             | nobody in environment             |
| 1%                                 | stationary (sleep)                 | no body movement only respiration |
| 2%-30%                             | slight motion                      | slight motion from head or limbs  |
| 31%-60%                            | walk/quick body movement           | relatively slow body movement     |
| 61%-100%                           | run/big movement in close distance | quick body movement               |

## 7. Instruction of Protocol

This protocol is applied to the communication between 24G millimeter wave detection radar and host computer.

This protocol briefly introduces the radar work flow, briefly introduces the composition architecture of the interface protocol, and gives the control commands and data required for relevant radar work. The definition of serial port communication is as follows:

**Interface level: TTL**

**Baud rate: 9600bps**

**Stop bit: 1**

**Data bit: 8**

**Parity check: No**

## 8. Communication Commands and Parameter Definition

### 8.1. Definition and Instruction of Frame Structure

#### A. Definition of Frame Structure

| Initial Code | Data Length |         | Function Code | Address Code 1 | Address Code 2 | Data   | Check Code |         |
|--------------|-------------|---------|---------------|----------------|----------------|--------|------------|---------|
|              | Lenth_L     | Lenth_H |               |                |                |        | Crc16_L    | Crc16_H |
| 0X55         |             |         | Command       | Address_1      | Address_2      | Data   | Crc16_L    | Crc16_H |
| 1 Byte       | 1 Byte      | 1 Byte  | 1 Byte        | 1 Byte         | 1 Byte         | n Byte | 1 Byte     | 1 Byte  |

### B. Instruction of Frame Structure

- a Initial code: 1Byte, default 0X55
- b Data length: 2 Byte, low byte first, high byte after
- ✚ length=data length+function code+address code 1+address code 2+data+check code c  
Function: 1Byte
- ✚ Data read: 0X01
- ✚ Data write: 0X02
- ✚ Passive report command: 0X03
- ✚ Active report command: 0X04
- d Address: address code 1 function classify, address code 2 specific function
- e ✚ Please refer to instruction of address distribution and data information
- f Data: n Byte
- g Check code: 2 Byte, low byte first, high byte after  
Use CRC16 for check, please refer to Appendix 1

## 8.2. Address Distribution and Data Information Instruction

|   | Function code | Address code 1                              | Address code 2                                     | Data | Remark  |
|---|---------------|---|--|------|---|
| 1 | Read<br>0x01  | Mark looking up<br>0x01                     | Device ID 0X01                                     |      |   |
| 2 |               |   | Software version<br>0x02                           |      |   |
| 3 |               |   | Software version<br>0x03                           |      |   |
| 4 |               |   | Protocol version<br>0x04                           |      |   |
| 5 |               | Looking-up<br>radar<br>information<br>0x03  | Environment state<br>0X05                          |      |   |

- Instruction:**
- 1) Data read/write: command sent from host computer to radar
  - 2) Report command: information sent from radar to host computer
  - 3) Gear of sensitivity of human body from 0~9, default 6, bigger the gear, higher the sensitivity
